if you can't afford to ring directory enquiries. ;>

To fit it into an STe you need to use an adaptor which piggybacks onto
the CPU socket: not for the faint-hearted (and not to easy to get back
into the old clamshell case). But it works just great.

You should disable the unit attention if you have a TOS <=1.04.
With the unit attention disabled everything works fine.
You can disable it with a jumper (but I havent the spec by hand.)

Ab> (MK-II?). It seems really expensive compared to the standard Falcon.
Ab> Is this because of a new OS, better CPU, or what? I would like a
Ab> Falcon, but it seems a high price to pay if it's not a lot better...

The large factor with the C-Lab Falcon MkII is that it comes with
14Mb of RAM as standard. It also has a 500Mb SCSI-II internal HD. I've
also heard that there was some fine-tuning of TOS involved, but I can't
substantiate that rumour. Otherwise, it's the same case, same CPU, same
everything. (Oh, they fixed the audio I/O problems with distortion, etc).

mark weddle <markw@southwind.net> wrote:
>
>I know next to nothing about the models and their audio capabilities but
>would like to find out!!

There's only one model for audio work: Atari Falcon 030 (now manufactured
by C-lab and named C-Lab Falcon MkII). Atari has quit computers, and the
design of new TOS-based (Atari's operating system) computers is now
in the hands of few smaller (but more effective) companies.
Standard Falcon is driven by Motorola 030/16Mhz, but that is very
sufficient because the OS is so light.

>What connections are on each model? (such as midi, audio in\out, etc.)
>Which models have a built in DSP?

Falcon has 1 built in DSP, along with audio sub-system that allows you
play 8 simultaneous channels of non-compressed 16bit/48Khz audio (D2D).
It has 1 stereo input and 1 stereo output, plus Midi in/out ports.
Record while playing is possible, also using RAM as sample memory.

You can expand it with relatively cheap add-ons: SPDIF-interface
with optical/coaxial I/O and DAT backup software, interface which
gives you 8 more analog outputs, and a few Midi expanders with
4-8 in and 4-8 out and some with SMPTE I/O and MTC.

For Direct-to-Disk work you'll have to get an external case for
SCSI-drives (there's no room for them in a standard Falcon).
Falcon has SCSI-, Printer-, Modem-, Audio-, ROM-, DSP-, Monitor-,
MIDI-, LAN-, and TV-ports.

Rack cases are available (and recommended). C-lab is planning to produce
a pro-Falcon with 040 and 2 DSP's, with 8 outputs, Digital I/O, SMPTE/
VITEC sync card and enchanced graphics capabilities - all in one rack case.
You can get a 33Mhz/040 accelerator for 950$ from Wizztronics.

>What digital audio recording hardware\software is available for the Atari?

There are several Shareware programs, that can do stereo recording with
effects. then there are a few commercial Direct-2-disk recorders (4 or
8 tracks with effects, but no MIDI - although some have SMPTE or MTC
sync).

some names:

D2D edit
Musicom

Clarity

Cubase Audio Falcon (CAF) is the program to get, if you need integrated MIDI/Audio (128 track of midi + 8-16 tracks of audio with realtime effect). It's manufactured by Steinberg.

The program "core" is same as Cubase Score 2, added with Digital D2D audio (44,1 or 48 khz /16bit) and plenty of editing power (non-destructive) and DSP manipulations. It can have 1 realtime-effect at a time (choose from 10-band graphic EQ, Reverb, Chorus or 3-band parametric EQ) - everything is automated.

Logic Audio Falcon is also available (no realtime effects), but CAF is sooooo much better....

Hope this helped.

Source record: 26467

There are three versions of the IOMEGA tape Drives - none are SCSI. The 1080-PX connects to a PC thru a parallel port. (Writing software drivers would be a major pain because the protocol is IOMEGA internal). The IOTAPE 250 is a QIC-40/80 compliant drive and connects to the floppy controller (writing the software is still dificult but at least specs to the Atari floppy controller and to the QIC spec are public information). The third type I dont have a model name for connects to a PC IDE interface (again proprietory spec per IOMEGA). All three drives hold 120 MB of uncompressed data on a DC-2000 cartridge (about $15-$20).

: FATSPEED helps a lot, but i thought to try the ROMS (1.6) from my
: daughter's STE. They wouldn't work - my STFM just sat and did zilch.
: Anyone know why this should be? Are STE & STF ROMs different?

They certainly are. You can't use STe ROMs in an ST(F)(M) simply by plugging them in.

TOS 1.6 actually lives in a different location in memory to prior TOS releases, and the STe has different hardware that must be treated in different ways. Similar machines, but not close enough.

[The base note asks if Mac InterNet tools run on the Mac emulator.]

In the two Mac emulator's I've written, I constantly saw programs
which referred "to the metal" -- to the specific chips inside the Mac.
I couldn't get several of them to run, in fact. (You can see I had to "map"
all the Mac HW accesses to ST HW).

In terms of EtherNet and TCP/IP protocols for the Mac, I'm out
of my league. However, I've seen (in ads) that they plug into the serial
ports, which are driven by an SCC 8530 chip, or the SCSI port, which
is driven by an NCR 5830. Neither of these is in the Atari, and there would
have to lots of chip specific code in the Mac programs to drive them.
This'll translate to a "bus error" crash when the emulator sees memory
up where these chips are mapped ($580000, SCSI, and $9 xxxx and $B xxxx for
SCC) being accessed.

The former Gadgets by Small company marketed a product called
MegaTalk, which plugged into the expansion slot of the Mega-ST (ONLY!).
It had the SCC, the SCSI chip, and the addition VIA timer used by many MIDI
applications. It also had the 2 DIN-8 and 1 DB-25 connectors for hooking
up serial, "printer" or network, and SCSI devices. I recall running a Mac
formatted HD and LightningScan off the SCSI hook, and LaserPrinter II'd off
the "network" port, and ran a modem off the "serial" port. It was very
highly compatible. (Heck, we were *adding the Mac chips*, you might say).

There is, thus, a very high possibility that with a MegaTalk board,
and software version 3.0 that is needed to be compatible (the current ver),
that Mac TCP/IP, SLIP, PPP, Mosaic and whatnot would work.

I am no longer with Gadgets by Small, which went away last November.
I know that there are some MegaTalk boards out there, and possibly you might
be able to pick one up. (You WOULD need a Mega-2 and Mega-4 ... nothing else
fits!)

As for mapping accesses into the SCC chip in the TT or Falcon,
well, it's a trip. The AppleTalk ROM, for instance, uses timing loops (!!!)
to cause delays in the AppeTalk/LocalTalk protocol, and the TT cache blows
that away (along with the TT bus, in ST RAM, seeming to run at twice ST speed,
without cache...) Gadgets never did get the TT's SCC to rcv Appletalk;
we did slow it down enough to match the patterns sent by a Mac IIfx.
The Falcon would be closer, but since it's slowed by ferocious video
contention, it might not be predictable.

If you were *real* clever, you could go in with the MMU of the 68030
and trap all accesses to the SCC and SCSI chips, and simulate them. This is
not trivial -- be sure to get a virtual memory implementation for the 030

and study it to find out how to restart after a bus error, for example. Just determining what register (or other thing) is storing/reading the chip is a trip in itself. Still, now, Bill Teal got a VERY compatible PC running in emulation, with serial chip emulation working, with PC-Ditto, and he didn't use an MMU.

I think it would be many month's work to emulate the SCC and SCSI chips successfully, and you're just plain speed limited by divide-by-16 on the MFP srial chip to 19,200 baud (and that ain't great).

I hope this helps define the "perimeter" of the problem at hand.

1853. Re: SST accellerator card

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-05 00:00:00 UTC
From: dsmall@well.sf.ca.us
Message-ID: <3oeci3$ias@nkosi.well.com>
Source record: 26472

[The base note refers to a used 50 Mhz SST board.]

When I was with Gadgets, we tested the SST at various speeds.
Depending on PALS and so forth (if we got a particularly zippy set),
we could hit 46 Mhz touch&go ... sometimes have to cool the chips down
with freezemist to sustain it. 40 Mhz was pretty safe, 33 Mhz (shipping ver)
was always fine.

Essentially, you run into propagation delays. Note the PALs have
-15 on them -- that means 15 nanoseconds (billionths sec) for electricity
to get through them. Lightspeed is around 1 foot/ns, electricity on a PC
board runs 1/3 of that (copper). So around 50 Mhz, you have to be *very*
careful about all the signals getting to where they should go in time.
When silicon heats up, it generally slows down, and *bang*, you crash.

The SST manual recommends testing the board out and finding its
envelope, then backing off a little bit for safety.

The SST itself was planned for 16 Mhz, then 32 Mhz when other
parts appeared that were rated for 32-33 Mhz. The extra Mhz is probably
a bonus of a good design (minimal ground bounce, minimal inductive effects,
and so forth.)

However ... I did a lot of writing and stuff on SST's, where
a crash would be a disaster, and I played it conservative, in the 33 Mhz
range.

Don't go 48 Mhz or under 18, by the way.

Again, I am a *former* Gadgets employee and this is just idle
chit-chat. If someone has the board running 50, great!

-- thanks, Dave Small / formerly of Gadgets / VP R&D

ps. Gadgets went away as of Nov. 1994

(Base note mentions trouble with PAK030 and net cartridge)

You *may* be running into a problem I did with the TT.
The cartridge timing is not identical to the ST -- the address
lines decay REALLY fast after "cartridge chip select" (the FA and FB
lines) go false. A lot of people "latch" on that edge, assuming
the address lines will be okay. It worked fine on a pre-production TT,
not on production. Drove me crazy.

You *may* also have a blown fuse on the TT cartridge port.
It looks like a little resistor, just to make life fun. Test for +5 V
at the port. If the fuse blows, 'nuthin gonna run on that cart.

The fix for the timing thing is not that bad ... latch on the
FALLING edge of the fa/fb select + some arbitrary delay (62.5 ns?),
so you're in mid-cycle, when the address bus should be okay.
(You have to write to carts using the address bus, since the cartspace
is RO via the Atari chipset.)

Of course, test the net cart on an ST, and test it on your
production system, if you can, without the PAK board, and make sure
all is well up to there. Could be a popped decoder or something somewhere,
too.

I hope this helps.

Source record: 26241

I have two Mega STe's. Both have 4 meg of RAM and TOS 2.05. I
have an external hard disk case which works fine on one of the Mega
STe's, but doesn't get recognized properly on the other. Both computers
have the standard 50 meg internal drive which is SCSI ID 0. The external
case has a 44 meg Syquest drive at SCSI ID 1 and an 80 Meg Seagate ST296N
at SCSI ID 2 and an ICD AdSCSI+ host adapter. I'm using the ICD hard disk
booter version 6.5.5 PRO.

On the Mega STe which doesn't recognize the external drives, the
ICD booter lists SCSI ID's 1 & 2 but says "UNRECOGNIZED UNIT" for each one.
The only thing I know of that is different about the Mega STe which won't
recognize these drives is that it has a 1.44 meg floppy and the
internal hard disk was originally formatted using AHDI.

I'd appreciate any suggestions on how to correct this problem.

If the question hadn't been asked - I wouldn't have posted my answer. All the things you suggest are 'reasonable usage' - but it doesn't mean they are legal.

However the original question was basically to determine if copying ROMS *and giving them away* was pirating or not. It is - and its as simple as that.

> What if I want to burn my TOS in faster or wider EPROMs? That, again,
> should be my right.

Maybe it should be - but it isn't necessarily.

Roland.

Al> daughter's STE. They wouldn't work - my STFM just sat and did zilch.
Al> Anyone know why this should be? Are STE & STF ROMs different?

Yes. TOS 1.06/1.62 have code in them to access the STe-specific
hardware that is not present in the STfm. Your options are either 1.04
or a jump to 2.06 with an accompanying modification.

argv[0] is a null pointer. Unfortunately, GEMDOS doesn't point it at the
name of the program.

1868. ST XFormer cable?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-07 00:00:00 UTC
From: followel@ix.netcom.com
Message-ID: <3oh7h1$bel@ixnews3.ix.netcom.com>
Source record: 26482

Hello All,

I've started using the old ST XFormer and PC Xformer again. I'd like to make an XFormer cable so that I can hook my 8 bit drive directly to my ST. I know there was a pinout / instruction file floating around at one time. Can someone direct me to this file or tell me the pinouts of the cable ends so that I can make my own? It would be greatly appreciated. Thanks in advance.

Sincerely,
Byron Followell
followel@ix.netcom.com

P.S. - I'm sure i'll have several posts concerning where I could buy a cable or people who are interested in selling me their old one's, however, as I have ton's of spare parts around the house, i'd like build my own.

: |> Using Multitos (MiNT+ the New AES) Makes my Falcon so slow, so I can't even
: |> dare to think of how slow it will be on a ordinary ST!
: You don't have to use MultiTOS to run MiNT. Would be possible to write a
: GEM based browser that used MiNT-net & have it run under single tasking
: GEM just as well. If someone compiles the MiNT-net & MiNTlibs libraries
: for Lattice C, I'll do it my bloody self just to prove a point (bet it would
: be fairly easy if you poach the actual http code from chimera or Lynx).

I wouldn't hack the code out of those browsers ... both use the CERN WWW
library which is available from info.cern.ch. I believe someone (I can't
remember who now) has already compiled this under GNU C. It contains a
whole load of stuff which helps out with parsing, caching, fetching,
translation for ftp and gopher URLs etc. It looks neat, but big, and
would probably take a while to learn.

ATB,

Martin

From: smselick@ios.com
Message-ID: <3oihg1$m5v@ankh.iia.org>
Source record: 26489

Hi!

I've gotten X up and running just fine, and have used ppp with an X server to run Mosaic, and such on the ST.

I now have to use Chimera since it is a long distance phone call to a real PPP account (I use TIA now) and I can't do a real X connection with TIA (can this be remedied?)

So here's what I did - I run Chimera instead of Xterm so I have enough memory to use it. Problem is, 9 times out of ten, it bombs while printing my home page on the screen. If it makes it through that, it is just a matter of 3 or 4 new document loads before it bombs anyway. The Internet connection runs fine though.

Am I just plain running out of memory?

Get something like Mark Baines' Profile that tells you loads of system
information, or there are plenty of other system info programs.

A last resort is going by the copyright dates in the desktop info, although
I don't know which refer to which TOS versions.

|> > Craig.
|> > (Who doesn't really care, 'coz he has Chimera running fine under MiNT-X+Fvwm)
|> And who surely has >4 Megs :-) If not, please tell me how you've managed to
|> squeeze it in! I can run it all but I have virtually no memory left for
|> pages and file transfers if I do.

Nope - just 4Megs on a falcon (32Mhz). I only run pty & kbd from MiNT.CNF,
xinit runs the X server, then launches an Xvt+sh shell to configure X with
the xmodmap patch & also does an xhost + for me. Fvwm is run last by xinit.
The GoodStuff button bar is launched from .fvwmrc as a module, and I have
DIP (connect & disconnect) and Chimera as buttons on the GoodStuff button bar.

DIP is run inside an Xvt window, so I click DIP(connect) and wait 30 seconds.
When the DIP window closes, I click on Chimera. Up it comes, no problems
(apart from a few 'font not found' style messages), and it runs fine.

It's not like I've got a really minimal setup, I've got a few extra fonts
in besides the naff default one, and new Icons for everything. Also, I'm
using FalconScreen to run MiNT-X at 880*640 mono, expended to 1920*1280 using
the Fvwm virtual desktop (*4, using GoodStuff's multiple desktop buttons)...
...so folks should stop moaning :)
It's very misleading when people say you need 8Meg to run Chimera, it's just
not true - it runs ok on a 4Meg machine.....

DevpacDSP is full of bugs...
Many adressing modes are not allowed though they should.

If I have an advice: use the Motorola assembler: a bit slow but it works
perfectly. You may need a tool because several programs need to be called, but
it's not difficult to write and it has already been written...

Did you format your boot partition less than 16 or 32 meg?

And unless you use software to change the setting of Falcon, you have to
wait for a long time to boot from SCSI.

Perhaps try it with "const char *argv[]".

>{int c;
> c=argc;
> printf("\n%d\n%s\nOK",c,argv[0]);

argv[0] may be undefined under TOS. argv[1] contains the 1st argument of
the commandline.

How much mem do you have ? I've had chimera die on me before, but it's
a problem in 1.63 with parsing certain pages - it always hangs up on
one of the pages here at newcastle......

|> The Internet connection runs fine though.
|>
|> Am I just plain running out of memory?

If you have 4Meg, then thats not the problem. Try using Fvwm instead of
Twm to get some more memory back (Fvwm is better anyway).

Craig.

I've had the "16 mhz blues" in two flavours:

1. The socketted chips had become a little loose. Pressed them back.

2. The CPU gets tooo hot after approx 4 hours of use. Glued some extra
metal arrangement (what I found in the kitchen) on top.

1887. slm 605 probs

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-08 00:00:00 UTC
From: nhcfwett@rrzn-user.uni-hannover.de
Message-ID: <1995May8.104727.5929@newsserver.rrzn.uni-hannover.de>
Source record: 26256

Help !

I have some problems with my laserprinter SLM 605:
The discharge wire behind (looking in the paper feed direction) the little 5 mm black
roller was teared up. One can look at this, if the the drum and developer unit is removed.

problem 1:
Which is the material of this wire ?
I've replaced it with a 0.1 mm diameter tungsten and a 0.2 mm copper wire
and i've only succeeded with the tungsten wire for 4-5 times. The original wire
looks like brass or something which is coated with gold.

problem 2:
What is the exact position of the wire ?

like this:
(- , \ , / is for the wire, + is for the little roller
X |-------------------|-O
o o |
| | o means the items, over which the wire is stretched,
++++++++++++++++++++++ |
or this: X means the position, where the spring,
O means the position, where the loop is hanged up.
X | | O
\ o o/
\|-------------------|
++++++++++++++++++++++

If I open the printer while the paper is just completely inside, I can see
clearly the letters or pics on the drum, but only with a weak intensity on the
paper.
I'm not quite shure wheather there's another item which was damaged, because
at the first try as I replaced the wire, there were 4 to 5 good printings,
but then I've heared some squeeking sounds and afterwards the printings had
the same poor quality like before.

Please help me, in the next 2-3 weeks I'm particular dependant on my slm.
(perhaps someone can have a look in his slm 605 to tell me, where the exact position
of this wire should be).

Thanks in advance,

>a problem in 1.63 with parsing certain pages - it always hangs up on
>one of the pages here at newcastle......
If it just hangs and stays there, it's probably not a memory problem (that
happens once in a while on very specific pages). If it closes itself
after it bombs that probably is due to lack of memory - I have seen this
happen on 4 meg machines.

>
>|>
>|> Am I just plain running out of memory?
>
>If you have 4Meg, then thats not the problem. Try using Fvwm instead of
>Twm to get some more memory back (Fvwm is better anyway).
Definitely get Fvwm - and make sure you only have one pty running and
keep your font set to a bare minimum. Also, make sure your /bin/sh
is small (ie don't sub it with tcsh or something) since a shell is
always in memory for the .xinitrc file parsing. AS well, don't use
MintOS init and getty stuff since these process will also take up
unecessary memory. Basically try to run a bare minimum system because
Chimera really likes to hog a LOT of memory.

1889. HSMINT?? and TT video card questions

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-08 00:00:00 UTC
From: sasmesba@kingcong.uwaterloo.ca
Message-ID: <D8A2Bp.DrJ@watserv3.uwaterloo.ca>
Source record: 26258
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello all,

1) Some people have been mentioning an HSMODEM driver for MiNT (so that MiNT uses the HSMOD routines instead of its own) - where can I find this?? (I tried looking in many archive sites and archie also turned up with nothing)

2) I'm curious about TT video cards - is it possible to switch off the TT inernal video (so as to speed up the bus for the CPU?) IF I get a video card with VRAM, I assume then the TT video can be off and the video should then be very fast since the video card should not really tie up the bus on a regular basis - is this how most video cards are set up? I assume a DRAM video card + TT video would be a real bus hog. Anybody know for sure or have any specs?

Thanks,
Sam

1890. Laser C

E > but not on my paycheck. Unless they have a student price????

One very popular Shareware 'C' compiler program is the Sozobon
("No Bozos") compiler. This is the compiler used by Holger Weets to
program ST-GUIDE, so you can be assured that it's a pretty good
program. The latest version, the "Heat n' Serve" compiler is also
available for download.

There's also a GNUSOFT compiler available for the ST, but that
one requires a fair bit of RAM and a hard drive to utilize it.

>Did you format your boot partition less than 16 or 32 meg?

This is not necessary, my boot partition is 100 Mb...

I use the Hushi SCSI tools (5.x) and they are considered very good, my DEC RZ28 SCSI drive does not start it's spindle motor unless it is told to do so (which the TT does not..). Result is that I can't boot from this drive, it also has the nasty habit of always being SCSI ID0... With Hushi however it is possible to boot up from the second drive (ID1) which starts up the first (ID0) and then run stuff from the first drive, my C partition is on the DEC and is 50 Mb, the boot partition 'I' is on the Quantum and is 100 Mb, no problem...

: I STUFFED UP but I honestly don't know how, as I only took out the drive,
: turned it over and looked at it. Now....NO WRITING to it. Write error,
: write error etc.....

: Help !!!!! Please.

First of all...it's a Seagate. That should explain everything. The
Seagate brand is to hard drives as the Yugo brand is to cars.

Anyway, try running a "Mark Bad Sectors" type of program. If you have
the AHDI driver, then run the HDX software and click on Mark Bad. If you
have the ICD, then run "HDUTIL.PRG" and click on "Mark Bad Sectors".
Once that has been completed, you may use the drive (hopefully).
However, I do recommend backing up what's left and doing a complete low
level format and partition. Some older HDD's were very sensitive to
movement and vibration. It's not just a so-called "head" problem. It
could even be the vibration itself actually repositioned microscopic
magnetic molecules causing them to change their orientation (think back to
your physics).

My two Seagate mechanisms are also quite sensitive to vibration even when
parked.

I hope this helps.

Rich

P.S. For those of you that think I'm am "full of it" in the physics
arena. Remember, any metal rod, tool, etc. that is struck on one end
violently (like hitting it on concrete) becomes magnetic. That's because
the molecules become more uniformly positioned instead on just randomly
placed. Try it with a wrench...

>
> It's too expensive, you could probably get it cheaper as an Atari Falcon
> and add the extras.

From the Digital Village price list (Paul Wiffen, head honcho at DV, is AFAIK the man who persuaded C-Lab to go with the Falcon rather than a PC or Mac-based system):

Falcon Audio Plus: Atari Falcon, 270MB Syquest + CAF - UKP2500 inc VAT
Falcon Audio Plus w/ C-Lab Falcon Mk II, 500MB int + CAF - UKP2500 inc VAT

Spot the difference. CAF is Cubase Audio 16 for Falcon. The Atari Falcon system uses Syquests rather than a fixed HD (speeds approx. equal) but apart from that the systems are identical; both also include the FDI (RRP UKP350) Subtract UKP1150 for CAF and the FDI and you're left with UKP1350 for Falcon, 14MB RAM and 0.5GB of HD - rather more reasonable. I haven't seen an unbundled price but that's hardly suprising - if you're selling a computer as a digital audio workstation it's kinda useless w/out any digital audio software.

1899. Using a Seagate ST41650

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-09 00:00:00 UTC
From: bjb@bigbox.demon.co.uk
Message-ID: <800048496snz@bigbox.demon.co.uk>
Source record: 26268

Hi,

I have just got my hands on a Seagate ST41650, 1.5Gig harddisk but I can't get it working. I have tried on an Atari Mega STE adapter and a GESoft host adapter, an with HDX 5.0 and SDMANAGE software but I can't format it - it doesn't seem to judge the size correctly and HDX just bombs when it gets to partitioning. Also, I want to partition it mainly as a Minix drive, but I am unsure what the situation on Minix FS and 800 Meg partitions is :-) Finally, I am currently using Minix FS 0.6PL11 but have a few problems. Whenever I try and ls -l a symbolic link I get an error, and secondly, fsck quits saying something like Super block not written out when drive f: invalidated.

Any help appreciated...

One of the good things about Ataris is that they have a phono socket
on the back for an RF lead to a TV aerial socket, so there should be
no problem. Sounds like an enlightened school!

I don't think Cubase is compatible with any multi-tasking OS. The only sequencer that is is Logic, which does run under MagiC and Multitos (but I dunno about Geneva).

The best bet is to run Cubase with NVDI, I think...

My guess is that it's harder to get hold of a 720K drive than a 1.44MB
one! I've replaced my 720K drive with a Sony MPF 520-1 drive which
I intend to run in HD mode when I get the circuit done, but right now
I use it as a 720K drive. I didn't cut the case or anything like
people always say that you have to do with a 1.44 drive, I simply
did a little modification to the disk button tab and changed over
the front and eject button from the old drive.
Apart from that you have to turn the connector upside down and
short the disk detect switch.

I plan to make a complete info file with diagrams when I'm done, and
will upload this. The biggest problem now is finding the besat alternative
for the HD/DD switcher circuit.

1907. Floppy disk replacements for Atari 1040

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-09 00:00:00 UTC
From: sdelaney@steil.demon.co.uk
Message-ID: <800050554snz@steil.demon.co.uk>
Source record: 26276

Yes, any 720k PC drive will work technically, but you will probably encounter problems with disk changes not being logged in properly. Usually this can be demonstrated by changing the disk and pressing ESC to no avail. However, this often works fine but you cannot log in a new disk from within an application. There's a program called FMC (Force Media Change) which goes into the Auto folder to get round the problem. If you buy an Epson drive SMD300 (or SMD3000 springs to mind) you will not experience this problem. Atari have been using Epsons in the ST/E for years now. Hope this helps

> Seagate ST157 (48 Meg), drive itself to be faulty.

One possibility is that the pin on the SCSI connector which selects read /
write operations is not seated properly or shorting, maybe to earth.

From the documentation I have with my GESoft host and Seagate ST157 drives:

All SCSI odd pins are connected to ground, except pin 25

Those particularly worth checking, at both ends of the cable, are:

pin 36 -BSY = busy control signal
38 -ACK = acknowledge control signal
40 -RST = reset control signal
42 -MSG = message
44 -SEL = select
46 -C/D = control / data
48 -REQ = request
50 -I/O = input / output control signal

From the symptoms described check particularly that pin 50 isn't bent or
loose. Pin 1 on the plug or socket should be marked with a small arrow or
other symbol.

Connector layout:
```
------------------------50
1------------------------
```

If you fiddled with the DMA connector to the host board then check that pin
18 (read / write) is connected OK and that any socketed chips on the host
adapter board are properly seated.

Please use suitable anti-static precautions when handling the circuit board
and / or HD, touch a well earthed object first to discharge any personal
static charge.

OK, Devpac DSP is not PD, but is only(?) 50 pounds and is pretty good
although it has sparse documentation. It is obviously written in C
but it is quite fast and stable. There is one bug I've found with using
too many labels that start with the same letter(s).

I still recommend it.

Alan.

p.s - mail me if you want to discuss DSP programming at all.

I have the an Atari 1040STe. Is there a way to replace the 4 256k Simms on the system with 4 1meg ones to get 4Megs of RAM? Or is the machine designed to accept a total of 1meg? If this will work, what kind of RAM would I need specifically? Also, I have a couple of SCSI HD's in an external box with 50-pin SCSI-1 type connecters. Can I just hook them up to with the appropriate cables? Thanks for any info.

What you need is a PLCC socket adapter (square, plugs into the PLCC socket)
and a normal PLCC socket on the other side of your PCB. I think Emulation
Technologies manufactures such socket adapters. Beware, however, that the
prices I know of are between 40DM and >100DM for one.

>available for download.

Heat-n-Serve C is decidedly not the latest version of Sozobon, and it
hasn't been supported for years. The latest version of Sozobon is
SozobonX by Jerry Geiger. Unfortunately, it is only available AFAIK
from ftp.fu-berlin.de, and perhaps from some other German FTP sites.
SozobonX is not ANSI, but it can be made ANSI by adding the c68 package
by Thorsten Roskowetz, available at a.a and mirrors.

>
> In other words, the 68000 connects to the same IC socket as before, but
> in addition, a new PCB comes between.
> How do i solve this problem?

This is a tricky one. Here's some ideas:

IDEA 1

The only case that I have seen of this is
with an In-Circuit Emulator for the 68HC11. What they did was to fit four
very small PCBS in a square to the main pod PCB. These four then fitted
snugly inside the PLCC socket. I will attempt to show this in ASCII graphics:

SIDE VIEW BOTTOM VIEW

```
__________________Pod PCB ________ Pod PCB
| |<----small PCBs | |
|| || | | small PCBs
| |<--PLCC socket | |<--(4 of them)
_________|_________|_________ |________|
```

It could be very tricky to make this yourself though. For a start
the small PCBs must have fingers at the same pitch as the processor (I don't
know what the 68000's is, but the 68030 is 0.025inch I think - very tight!)

Idea 2

It is possible to get dummy ICs - that is just the package with no
silicon inside. These are designed for space models and mounting practice.
You could try soldering wires or pins to one of these, going upwards to
the daughter board, and then push the dummy into the socket.
The dummies are available from RS as far as I know, in a variety
of sizes and pin counts.

Idea 3

If the socket is a PLCC to PGA one, then you could try this:
Desolder the socket. In the holes that are left, fit pins going up to
the daughter board. The best type of pins to use are the ones out of
DIN 41612 or IDC sockets/plugs, because they are small and should fit through

the holes in the PCB. Wire wrap pins are much larger and will not fit through most PCB holes (they need 1.5mm or so). Alternatively you could make your own pins out of some stiff wire.

Sorry none of these are brilliant suggestions.

> I've been looking through lots of catalogues for a suitable socket
> but with no luck so far, i don't even know what to look for (a PLCC wire
> wrap socket???)
> Any ideas?

You could try asking any of the In-Circuit Emulator manufacturers where they get theirs from.

There is a PD program to skip the memory test, hard drive wait
on boot-up. I can't remember it's name now, but it should be
on most ftp sites in the Falcon section.

BTW, this changes the NV Ram so it's more or less
permanent (unless you get a program to change it back).

Hi All!

Has anyone here had experience of setting up a Linux swapfile (as opposed to a swap partition)? I don't have the time or the spare disks to back up 50Mb to floppy so I can repartition.

I have tried

mkswap /etc/swapfile 4096
and
mkswap -c /etc/swapfile 4096 (I have no idea what the -c option does)

which both gave 'Could not open /etc/swapfile', so I touched /etc/swapfile and did it again, which seemed to succeed. I then put in the entry in /etc/fstab and rebooted. The system reported (IIRC) 4088Kb of swapspace, but as soon as it got used I got lots of 'Bad swapfile' errors. Can anybody tell me what I'm doing wrong?

My system is a 4Mb Falcon030, with /dev/hda4 mounted on / and /dev/hda3 mounted on /usr (both are 30Mb IDE partitions). The linux kernel is 0.9.5 from tsx-11, and everything works fine apart from I'm running out of memory when doing things like formatting large manpages.

ATB,

Martin

|> 50Mb to floppy so I can repartition.

Swap files are slower than swap partitions, because the kernel must go
through the filesystem layer to find the block number to use, whereas
on a swap partition they are just sequentially numbered. But the
actual read/write operation does bypass the filesystem layer, so that
the slowdown may not be that much.

|> I have tried

|> mkswap /etc/swapfile 4096
|> and
|> mkswap -c /etc/swapfile 4096 (I have no idea what the -c option does)

`-c' stands for `check for bad blocks', not needed with swap files.

|> which both gave 'Could not open /etc/swapfile', so I touched
|> /etc/swapfile and did it again, which seemed to succeed. I then put in
|> the entry in /etc/fstab and rebooted. The system reported (IIRC) 4088Kb
|> of swapspace, but as soon as it got used I got lots of 'Bad swapfile'
|> errors. Can anybody tell me what I'm doing wrong?

You have to create a proper file before running mkswap on it:

```
dd if=/dev/zero of=/etc/swapfile bs=1k count=4096
sync
mkswap /etc/swapfile 4096
```

(if: input file, of: output file, bs: block size, count: number of
blocks, /dev/zero yields an infinite stream of nulls). The swap file
must not have any holes, but if you run mkswap on an empty file it
will create such holes. sync is necessary to flush the buffers to
disk.

I see alot of writting about TOS EPROM programming / patching / copyrights etc here.

Last week I damaged one of my tos 2.06 EPROM when transfering my one and only tos 2.06 EPROM from 1 system to another. Now the Even EPROM is dead. The question is -- if I can get an EPROM image, and if I program in a new EPROM and use it, will I be infringing copyright?

E> Does anyone know of a shareware or PD 'C' complier for the ST series
E> computer.

There is a very good compilier call Sozobon C, and what's better is
it's free as in freeware. I have used it in learning C but got a good
deal from a friend on Lattice C. Sozobon C is not ANSI C but it's
close.

The other compilier is "GNU C" and "GNU C++" (it maybe "GUN C")
they are also freeware. I have downloaded it but got confused in
setting-up and using it so I stuck with Sozobon C.
From what I've read on GNU C and GUN C++ it very good and very flexable
if I could just figure it out.

I got both compilers from TAF, the BBS number is 416/421 8999, if it's
not on the BBS you can get it from TAF's library, just leave a message.

Did anyone hook successfully up an Atari ST (with host adapter) to a SCSI chain of a Macintosh to access all the 'accessible' SCSI goodies on it? (my CD-Rom, optical removable 600 Meg, Syquest 44, Bernoulli, and _perhaps_ the two scanners?)

What are the pitfalls of a such operation? Every advice is appreciated. In terms of Atari, I'm a newbie

George

1935. Harddisk or Papyrus problem?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-11 00:00:00 UTC
From: npetep@hasler.ascom.ch
Message-ID: <1995May11.062016.1812@hasler.ascom.ch>
Source record: 26354

I have on my Protar Profil 40 harddisk three partitions. On D: i have
I folder called papyrus. When I try to start the PAPYRUS.PRG in this folder
the following mesage appears "Daten defekt..." (datas are corrupted) and the
application cannot be started. After a couple of reboots it works finally.
This happens only with papyrus (until yet!). I tried already sveral things:
- reinstall Papyrus
- rename the old folder and install Papyrus again (so the new must be on
another Part of the disk)
but i got the same result.

Is this now a problem of my disk or from Papyrus? What can I do?

You DO however have the option of getting one of the many external
samling.playback cartriges, of which I would highly suggest the
ST Replay, or Stereo Replay cartriges...

On the other had, you can always just pick up a used 1040STe! ;-)

From: zonny@dds.dds.nl
Message-ID: <3osvvf$lme@news.xs4all.nl>
Source record: 26360

Hi.

Does anybody know anything about XtraRam-boards? I have an Atari ST with 2.5 Meg, and it's XtraRam. I've opend it up, but there doesn't seem te be a slot left to put another meg or so in. And that's what I want, preferable 4 Meg's total. Is there anybody out there, with a little bit of experience on 2.5 Meg upgrades? It was originaly 1 Meg, and I don't have the faintest idea why it works with 2,5 (Second hand machine, from my uncle, and the shop that did the upgrade closed down)

I thought ST's could only handle the 'right' ammounts of Mem...?

Greetz,
Thomas (zonny@dds.nl)

Yes, just remove the 256k SIMMs and install 1M SIMMs (with or without parity).

> Also, I have a couple of SCSI HD's in an external box with
>50-pin SCSI-1 type connecters. Can I just hook them up to with the appropriate
>cables? Thanks for any info.

You just need a need a host adaptor, eg. ICD Link, and cable.

When you are changing the SIMMs check the part number on the DMA IC U300, IIRC
part C398739-001 is ok, whereas part C025913 can result in corruption of data
on your drives. The replacement IC can be obtained from Best Electronics in
San Jose.

There's a file in Hensa: TP404V10.LZH
It has several patches to TOS 4.04, including the "make your own logo"
-patch. Bad news is that it has to be EPROMmmed, I think...

I think I know what you mean. Try doing:
cd /bin
chmod 755 su This sets executable modes
chmod a+s su This sets Setuid and Setgid mode

(I assume you have the file utils and so on)

You will then need to put names of anyone who can su root (if they know the
password) in the first line of /etc/group like this:

wheel::0:bjb,trojan,paul,root
:
V

> I would just log in as root, but once I log out, I can't log in again,

You need a new MiNT - MH-MiNT 1.12h2 will do the job nicely.

Steve Delaney (sdelaney@steil.demon.co.uk) wrote:
: Yes, any 720k PC drive will work technically, but you will probably encounter
: problems with disk changes not being logged in properly. Usually this can be
: demonstrated by changing the disk and pressing ESC to no avail. However,
: this often works fine but you cannot log in a new disk from within an
: application. There's a program called FMC (Force Media Change) which goes into
: the Auto folder to get round the problem. If you buy an Epson drive SMD300 (or
: SMD3000 springs to mind) you will not experience this problem. Atari have been
: using Epsons in the ST/E for years now. Hope this helps
: --

I experienced this problem with my Sony 1.44 drive which I just installed,
but by shorting the "disk detect" switch I solved the problem. It works
perfectly now. i guess the same thing applies for any other drive.
You just have to make the machine think the disk is in the drive all
the time. If the disk isn't you'll still get the "disk missing" message
because it can't read a disk that isn't there.

Surely licensing laws allow one to make backups/copies of
products for private use, be it music records/CD's to tape or software.
Copying and distribution is forbidden.
Therefore, one would think copying TOS and integrating a patch, to an
EPROM for personal use would be within the law.
However, why not simply stick with a software patch instead, and load
on bootup?

I can't remember the exact title, but there's a book in the Abacus series (now probably out of print) that has 68000 source for 3D graphics including hidden line removal etc. I'll think you'll find it has just what you're looking for if you can get hold of it...

Maybe someone can remember the title. I own a copy, but unfortunately it's about 250 miles away...

From: gjones@cs.man.ac.uk
Message-ID: <3ovtho$9t1@m1.cs.man.ac.uk>
Source record: 26369

Yeah, I've got the Abacus book, and it's not bad, although I seem to recall that some of the sources seemed a bit dodgy in places (not the 3D stuff itself - that was all nice and correct), but the setup code wasn't totally there in my opinion and I had to alter some of it. It was 'Real-time 3D graphics for the Atari ST' I think. I've got it and it's pretty good. My advice would be to send off for the disk - typing the source in takes a while....the code isn't particularly fast but that can be sped up fairly easily if you've got a decent knowledge of coding, if you've got a good knowledge of assembler you should be able to really improve the speed (I'm talking about those with access to clock cycle timings for the instructions here). I've never bothered speeding the code up - never really got round to it.

If you want I can mail you the source or put it on my WWW page or something.

I don't know the answers to your other questions but this is definitely possible. I modified a Ferguson T9 chassis to accept RGB and Sync and got very good results. My job was made easier because of the particular chip the Ferguson used for colour processing. Forget the details I'm afraid but could dig them out if of any interest to you.

Hello to all GFA Basic programmers

I have been trying to get GFA Basic compiled programs to run under
Magic.
There is a patch program on various ftp sites (GFA patch 1.07) that is
supposed to modify the compiler libraries. The only problem I have is that the
documentation is all in German!

Has anybody used this patch succesfully, or does anybody know where I
can get hold of the documents in English.

Contact me at the address below.

Thanks in advance.

Get the latest version on MiNT - something like pl12h3. It does not happen on that version. I had this problem, changed to one of the unofficial 1.12 versions - mint mailing patched kernels and it worked fine.

I think you will find it names sometedng like mint-1.12h3.lzh the 1.12. is the standard release and the h3 is the homuth patch level (?).

Not sure where you can find a full ypatched version, I patch mine from stuff posted in the mint mailing list.

Source record: 26380

Here's my dilema so far, I've pried off the case and the top shielding for my 520STfm. I'm down at board level, but I can't get the bottom shield off because there's some shielding around the serial/parallel ports that's blocking it's removal. Anyone had this problem before? Did you find a way past it?

Also I can see that the board has a place for a square shapped chip marked "ST BLITTER". Anyone know whether this means that my ST could make use of a blitter chip if one was added?

Thanks in advance...

>good pointer to a WWW server with tech documents.

Well, you can.... forget it :-)

You need a very good 'multisync' to go with the TT's mono output as it's
frequencies are very high, the vertical frequency is 71 Hz and the
horizontal about 77 kHz ! No ordinary multisync can handle these.
Furthermore the video output signal is an ECL output with both a positive
and a negative connection, your monitor can handle only analog and/or
digital signals in either 75 ohm RGB or TTL level RGB.
You'd better shop around for a used mono monitor (I have used a Viking
Moniterm 1 with success) as high resolutions on a 'small' (<15 inch)
monitor aren't usable anyway. The mono monitors have no 'dot-pitch' so they
give a sharper picture than whatever color monitor could ever give.

>The Internet connection runs fine though.
>
>Am I just plain running out of memory?

It has been my experience the more GRAPHICS in the Page the more likely
Chimera will crash. MY STe with 4M does it more frequenly than my TT with
6M. My friends TT with 12M rarely does it. So I've always assumed it's
a memory issue.

So by default I don't load the graphics.

As for crashing 3 or 4 pages after your page... (I haven't done this yet)
You might want to elimate the number of pages storied on your HD.this would
mean you have to reload every page... (these are just ideas. I haven't
tried them...)

There was a book called Real Time 3d Programming, by Andrew something I think. This had an optional send off for disk but I don't know if it is still available anywhere.

There was also 3D Graphics Programming, (from the same company that published ST Internals, and GEM Programming) but I don't know if that is still available.

(You should be able to get both of these from libraries though (if you know the full names :[ ))

Also ST World did a series a looooong time ago by Jeff Lawson, and there was a disk of source to accompany that series.

If that stuff is in the public domain then I could look out the disk, zip it up and put it on a site somewhere (assuming it isn't on a site already). Does anyone know if it is public domain? Or even if it is on a site already?

I know some of the code filtered into the budgie programmer's library so I think it might be.

Probably not the right newsgroup but.....

I've got a Microvitec 1438 monitor which can handle those tv sync rates.
Where can I get a modulator that runs in reverse so I can connect my video
(normal composite video output) to the monitor.

Would there be any way of hacking out my modulator from my old stfm and getting
this to run in reverse ?

Cheers,
Phil.

I replaced the 720K EPSON floppy in my STE by a 1.44M one of EPSONS, so
I had no proplems with the measures (?). I also build in a brutal HD-circuit:
I replaced the 8MHz quartz-osci by a little PCB with a 16MHz and 8MHz one
a little switch => HD is possible. (But no auto-detection, and the sound-chip
is twice as fast (tchiirp ;))
But it functions for about 2 years without any proplem (even its no 02-02 !)

You need some sort of TV tuner. I have an old Amstrad one converted for
my SC1435 - but it was a bit flaky - so I never bothered to rewire it for
my 1438.

Have a look in the newstand Electronic magazines. I can't remember the
company - but there is a regular advertiser who sells something that will
do. Its a full blown TV tuner which is more than you really need.
Its also about 60ukp though :-(

I *would* recomend Bull Electrical - *but* they are only any good if you know
what you need exactly. My Amstrad TV tuner costs about 15ukp from them -
but they are long sold out.

I believe there are composite video -> RGB boxes available - which *should*
be much cheaper - but I haven't found a cheap one yet.

> Would there be any way of hacking out my modulator from my old stfm

>
> What are the pitfalls of a such operation? Every advice is appreciated.
> In terms of Atari, I'm a newbie

If there are no other host adaptors (ie Macs) on the chain - then it
might work. Otherwise I wouldn't even attempt it.

The risks are lots of expensive damage. Its not too hard to blow SCSI
devices.

If you are going to try it then at least test each device *seperately* on
the ST first. If any one won't talk - then drop it from the chain.

Many Atari host adpators don't like parity. They also don't seem to assign
a SSCI ID to themselves - though the internel SCSI ports in the TT and
Falcon do.

Termination is also going to be a bit tricky.

Honestly though - don't even think about doing it.

:-)

Roland.

mark weddle <markw@southwind.net> wrote:

>I was wondering if the RGB pinout on the 1040stf is 15khz or 30khz.

15 kHz. Only the falcon supports 30 kHz for the st low and mid modes.

>Also, is the composite pinout live without an rf modulator?

Yes.

>I would like to use my tv as a monitor.

That is possible. These are the different possibilities, sorted by
decreasing picture quality:

(1) RGB color signals, horizontal sync and vertical sync pin (this is the
scart plug on good tv's)
(2) RGB color signals and composite sync pin (the scart plug on worse
tv's)
(3) composite color (not directly supported by the ST, but you can build
an adaptor very easy) and composite sync (this plug is often called
'video in')
(4) if your tv doesn't support anything else, get an hf modulator.

1974. PLCC for STe

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-13 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <3p2r0j$jdc@sinsen.oslonett.no>
Source record: 26298

Is there any way to "piggyback" a PLCC socket, so that I can put a circuit that
will access my PLCC type 68000 in my Atari STe and put my 68000 on top
of this again? Some sort of "adapter" socket in other words?

In a case of the 68000 being a DIL shaped IC I would have solved the
problem with a long-legged IC socket (wire wrapped socket),
but I haven't found anything similar for PLCCs.

here's a simple illustration;

```
---------------
68000 processor -> |\\\\\\\\\\\\\\|
------------------
*I need this socket!* -> | |
| |
Accelerator/IDE board -> ============================
| |
Existing PLCC socket -> | |
| |
STe's circuit board -> ==========================================
```

I've been trying to find a solution to this problem for months but with no
luck! I'm grateful for any help, or directions towards the help, so that I can
work this out. And in case you were wondering- I'm planning to build an IDE
hard disk interface for my STe, that's wy I need this socket, so I can let both
the new circuit and the rest of the STe access the 68000.

Hi, I'm having trouble with a Gasteiner Top Link Host Adaptor I've just bought. There appears to be no power getting to it.

I presume it gets its power from pin 26 of the SCSI connector. (Terminator Power). My IBM 0661-371 drive is not providing this, so I hard-wired +5v to pin 26 (not into the drive of course), but I still have the same symptoms..wonky ST that is unable to read from drive A: correctly with the Toplink plugged in.

I know the drive is OK and the power supply is large enough to cope easily. The problem is still there even when the toplink is not connected to the drive (but still plugged into the DMA port).

Any ideas ? Also, does anyone know if and how I can get the IBM drive to provide terminator power so I don't have to hardwire it in.

Cheers,

Kev.

1978. Notator Software Wanted

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-13 00:00:00 UTC
From: layman@pen.k12.va.us
Message-ID: <D8Iq4n.11H0@pen.k12.va.us>
Source record: 26388

I am looking for C-Lab Notator software (v. 2.0 - 3.1) complete
w/ manual/disks/dongle for use in Electronic Music Lab at my
high school. If you have upgraded to Logic or another format,
please consider selling your old program materials.
Thanks in advance
SRL

1979. Re: SCSI port on an ol' 1040?

|>
|> George

if you've got a color monitor or if the st is hooked up to your tv look at the atari symbol. If it is animated in color, you have a usable tos, if not, it is old. TOS 1.4 has had the nickname "rainbow tos".

Rule of thumb: if the machine is a (MEGA) STE, the TOS version is >= 1.6 in order to support the new hardware.

Most MEGA STs come with tos 1.2 (blitter tos). Some few of the latest machines --- but not all!!! --- have been shipped with TOS 1.4. But these are really rare.

Most of the 1040 ST/STFM come with TOS 1.0 (6 ROMS), some very few with tos 1.4 (2 ROMS). In fact, although TOS 1.4 was officially released, Atari equipped their machines with the old ROMS.

The only machine coming definitly with tos 1.4 was the laptop.

IF YOUR TOS IS 1.0 or 1.2 (official numbers 1.00 and 1.02), I URGENTLY RECOMMEND TO UPGRADE IT TO TOS 1.04 (=1.4). ITS MOST OBVIOUS ADVANTAGE IS ITS VAST SPEEDUP OF DISK ACCESSES. UP TO A FACTOR OF 4, REALLY! ITS LIKE TAKING A LARGE STONE FROM THE MACHINE, ESPECIALLY WHEN YOU UPGRADE FROM TOS 1.0.

Another advantage of tos 1.4 is its support of large partitions. The system calls of these three tosses are identical. So there is no APPLICATION for tos 1.4 which should not run under the ancient tos. There might be, however, some commercial programs which check the tos version and don't accept the old ones...

TOS 2.x and larger do indeed introduce new system calls, so there might be incompatibilities.

Does anybody know if a version of Word Perfect was ever released for
the Atari.
If it was could you please let me know where I could get hold of a
copy.

Thanks in advance.

> corruption of data on your drives. The replacement IC can be obtained
> from Best Electronics in San Jose.

Emphasis in the word 'can'. The DMAs fixed by Atari had the same C025913
part number and were suitable for running at 8MHz only. If you ever wanted
to fit a hardware accelerator or somesuch you'd have to get the DMA changed
again to something like the C398... as supplied by System Solutions.

An additional check as to whether you have a possibly dodgy DMA is to check
if your STE has a serial number starting A19 B300.... or A19 B301....
These were the problem ones IIRC.

1982. Re: Hooking up an ST 1040 to the Macintosh SCSI chain...tried?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-14 00:00:00 UTC
From: verysmooth@aol.com
Message-ID: <3p438m$22v@newsbf02.news.aol.com>
Source record: 26301

< If there are no other host adaptors (ie Macs) on the chain - then it
might work. Otherwise I wouldn't even attempt it.

The risks are lots of expensive damage. Its not too hard to blow SCSI
devices.>

Hi, Roland

There _is_ a Mac IIsi CPU on the other end of the SCSI chain. What kind of
"expensive" damage could I expect?

So far I have done almost every no-no ever invented in the history of
SCSI; pulled out/plugged in cables several times with everything running,
ran a SCSI chain twice the recommended cable length, and finally &
ultimately...since 3 years I run my chain with only one (1) terminator.
(The Mac CPU, of course.) At the other end (scanner) I have no terminator
at all...and it works. As soon as I plug a terminator in the scanner,
though, the chain crashes. To top it all I never had any hardware
problems.
So, in terms of love, war, and SCSI, anything goes, I guess :-)...

Seriously, think about it. In a SCSI chain, two terminators are needed.
Fine. I put the Mac CPU on one end, and the Atari on the other. So far so
good. As long as they don't access the _same_ drive at the _same_ time,
what could happen? As a remedy against signals running into each other, I
could perhaps make the SCSI chain long enough so that the two CPU's
signals won't reach each other only the devices between them. Kinda
un-terminated chain again, jut as it is now.

I'm still wondering if I need two computers running at the same time at
all as well. If only one is turned on at a time, the whole issue is less
problematic. I'll probably take this route, given that I can look only one
way at the same time, anyway... :-)

Enough reasoning to make all your hair stand up, I guess.... :-)

P.S. Do you think Mac devices use parity on the SCSI chain? I asked this
on a few Mac-specific BBSs and no one knew. Ah, we happily ignorant Mac
users... :-)

No such thing, however, the Falcon (that is what you have?) has a
composite video output pin on its monitor connector. It is pin number
12. In TV modes it has composite video, but in other modes (VGA etc.) it
only has composite sync.

Please - is there anyone using this combination?
After picking up a 2nd hand copy of WF2 two months ago I am still
struggling.

WF2 included both FSM & FONTGDOS and I at first left them uninstalled,
but WF2 crashed on loading the fonts (2 bombs). So..,
I installed the Fsmgdos = everything ok but no vector fonts.
This at least proves that WF2 works.
Today I have tried using Fontgdos with NVDI by disabling NVDI's version
of GDOS and now my speedo and ttp fonts appear in Wordflairs character
selection dialog- at last I thought I was getting somewhere! -but
as soon as I clicked on any of the displayed fonts the program crashed
back to the desktop.

If anyone has a clue ???
Many Thanks Alan

> Is there anybody out there, with a little bit of experience on 2.5 Meg
> upgrades? It was originaly 1 Meg, and I don't have the faintest idea why it
> works with 2,5

Is the computer a 520 ST or a 1040 ST..? (I suspect a 520...)

The MMU chip (Memory Management Unit) in the ST can address TWO banks of memory. You combine both of them to get the total RAM in the machine.

I suspect the XTRA RAM board has 2 Megs on it, forming one bank, and the ST itself has the original 512K on the motherboard (assuming it's a 520 ST), which forms the other bank. Thus, 2.5 megs total.

If the memory upgrade board could accept more chips, forming another bank, you would have to disable the onboard memory since the MMU chip can't control three banks. Assuming the new bank of RAM was 2 megs like the first one on the expansion board, this would give you a total of 4 Megs.

If the memory upgrade board can NOT accept more chips, there may be no way for it to go to 4 Megs... it might have been designed as a 2.5 Meg board only.

Now... if the board uses SIMMs, things get more interesting..!

I'm just guessing here, but I don't think the ST can use a single 4 Meg SIMM, unless the MMU can address a single bank of memory with a full 4 Megs in it. If it can, and if the board now has 2 1Meg SIMMs on it, you MIGHT be able to replace the 1 Meg SIMMs with one 4 Meg SIMM. You would still have to disable the 512K of memory on the motherboard, but you'd get the full 4 Megs that way.

Hopefully someone else will know for sure about the SIMMs business...

Also, the memory expansion board I put into my own 520 ST came with the instructions on how to disable the memory on the motherboard, so if you do find out how to increase the memory on the expansion board, and need to disable the motherboard RAM, e-mail me, and I'll send you the info I have...

Hi everyone,

I'm wondering what networking hardware and software is available for my Atari 1040 ST, specifically I'm hoping to hook it up to my existing LocalTalk network of two Macintoshes and a DeskWriter 550C. Is there an AppleTalk software package to make them all talk together and share printers/files? While I'm asking, what's the state of ethernet on Atari's and is there AppleTalk for Ethernet adapters too?

Thanks,

Hello,

I have a friend at Compo and he is considering working on a 486 hardware emulator for the Falcon. He needs as much info about the 486 series of chips as possible. I have posted to most of the ibm groups, but the backlog is unbelievable. There is a technician at Compo who is pretty in the know about the Falcon, but doesn't know much about the 486. If anyone can point me in the right direction I'd be very grateful.

Just to re-iterate, he reqiures full technical details.

Thanks.

Alan.

Let me make one point perfectly clear, I HATE Word Perfect.

I only asked because my Sister-In-Law is borowing my old faithful 520ST
to help with her college WP course and wants to run the same package at home as
she does at college!!!

Personally I use First Word Plus 3.2 on my TT, I know it is old and
dated but I have been using it for five years and have got rarther set in my
ways with it. I've tried Protext 6 and but it didn't 'feel right', I will take
a look at Papyrus though, it does sound interesting.

1996. STe blitter in games...

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-15 00:00:00 UTC
From: dking@gbc.gbrownc.on.ca
Message-ID: <3p8ece$3fr@gbc.gbrownc.on.ca>
Source record: 26315

Can anyone tell me how the blitter would be used in games programming? It is supposed to do fast memory copying but how would that be useful. As far as I know, I just create a second screen somewhere and change the screen pointer so I don't have to copy my second image into 'video memory'. Am I missing something? Also, my Mega STe soesn't have the analog joystick ports...I though all STe's did?

```
: Spot the difference. CAF is Cubase Audio 16 for Falcon. The Atari Falcon
: system uses Syquests rather than a fixed HD (speeds approx. equal) but
: apart from that the systems are identical; both also include the FDI
: (RRP UKP350) Subtract UKP1150 for CAF and the FDI and you're left with
: UKP1350 for Falcon, 14MB RAM and 0.5GB of HD - rather more reasonable.
: I haven't seen an unbundled price but that's hardly suprising - if you're
: selling a computer as a digital audio workstation it's kinda useless
: w/out any digital audio software.

Its a fair price in Falcon terms for that bundle, but consider for one
minute that a 540/8 Pentium (66 I think) costs around 1200 (ukp) thats with
a CD-ROM and LOADS of software. On this bases the Falcon has NO chance
of ever being anything other than a minority machine.

I like my Falcon and depending on a number of factors I intend to stick
with it.

> I missing something?

Yes, you are : this works perfectly for STe but not for ST that have
a blitter (my Mega ST 4 has a blitter). In fact on your STe you can
still use the blitter to draw sprites so that you don't have to keep
pre-shifted images of you sprites in RAM and for scrolling you modify
the video-reg the STe has.

> what could happen?

They shouldn't - when the SCSI bus is not being used by a device, it remains in the BUS FREE phase. If a device wishes to arbitrate for the bus, it simultaneously activates the BSY signal and the data bit corresponding to its SCSI ID (DB(0) - DB(7)) The device must then wait for at least 2.4us, then check the data bus again to see if an ID higher than its own has been asserted. The highest IDed device wins the assertion and asserts the SEL signal in response. All other devices should then release BSY and remove their ID bit from the data bus within 800ns.

In effect therefore, this shouldn't prove to be a problem.

> As a remedy against signals running into each other, I
> could perhaps make the SCSI chain long enough so that the two CPU's

Humm . . . in this case, the behaviour of the bus may well be . . . erm . . . undefined.

> I'm still wondering if I need two computers running at the same time at

Hi All!

I am wondering about something I just saw today at Office Max. It was a SCSI cable that connected to the Macintosh at one end and a SCSI device at the other end. Is it the same type that would be used on the Atari 1040STf in the Hard Drive port. It said 19 pin (I think it said twisted) to SCSI. If this is the case then I will probably buy one since that is what I would need to run an external SCSI hard drive with the ST. Also, does the 1040STf have a maximum amount for the size of the hard drive? I don't want to get one that is too big (if there is such a size). I can get drives and power supplies to make my own with no problem (I hope I can find SCSI drives with now with SCSI II and SCSI III out there too). Any help will be appreciated. Either reply here for all to see (would like that so if it can help someone else out too) and/or e-mail me at RichWegner@AOL.COM.

Thanks!

Blown SCSI chips and the like. Possibly even blown SCSI devices.

> So far I have done almost every no-no ever invented in the history
> of SCSI; pulled out/plugged in cables several times with everything

> So, in terms of love, war, and SCSI, anything goes, I guess :-)...

Sounds like me :-)

However after 3 years of happily plugging anything into anything with 100% success rate - my luck has changed. This year I have *blown* 900Mb of SCSI disk space (actually 930Mb ;-) and I currently have an unresolved cable/termination problem on my ICD AdSCSI+.

I've started to be a lot more careful. This week I've invested in 2 *decent* SCSI cables - and a little gadget called a 'SCSI Sniffer' which is a cross between a SCSI terminator and diagnostics box. It doesn't like my TT much at the moment though as it relies on the (non existant ;-) TERMPWR to power it. However for once I intend to get TERMPWR right on all my systems. I used not to care - but some devices are fussy.

> Seriously, think about it. In a SCSI chain, two terminators are needed.

Honestly - I did.

> Fine. I put the Mac CPU on one end, and the Atari on the other. So
> far so good. As long as they don't access the _same_ drive at the

Sounds like a case for BUS ARBITRATION. Most ST host adaptors can't cope with this AFAIK

> _same_ time, what could happen? As a remedy against signals running
> into each other, I could perhaps make the SCSI chain long enough so
> that the two CPU's signals won't reach each other only the devices
> between them. Kinda un-terminated chain again, jut as it is now.

I think this is just wishful thinking. Its unreasonable to expect the 2 host adaptors to fight it out on the bus. Its also unreasonable to expect relieable operation with a massively long unterminated chain.

Thats not so say it won't work - just that its unreasonable to expect it to do so ;-)

> I'm still wondering if I need two computers running at the same time
> at all as well. If only one is turned on at a time, the whole issue
> is less problematic. I'll probably take this route, given that I can
> look only one way at the same time, anyway... :-)

You will almost certainly be better off with one computer turned off. I have one shared drive - and I have it physically disconected from the computer not using it - when the other one is. I though about keeping both connected at the same time - but who knows what an unpowered host adaptor will do to SCSI signals.

> Enough reasoning to make all your hair stand up, I guess.... :-)

:-)

> P.S. Do you think Mac devices use parity on the SCSI chain? I asked

I can't remember - but I don't think so. My CD-ROM is suposed to work with MACs - and doesn't have an option to *enable* parity. Personally I turn parity off when ever possible. I have found though it is possible to mix and match parity and non parity devices sometimes. Some devices just plain don't care.

Good luck!

:-)

Roland.

I think its 'syslogd' you are missing.

Basically if you can live with the error nessage then there is no problem.
I don't have 'syslogd' running either - and I occasionally get this error.

:-)

From: tom_thomason@fpc.ct.se

On 13 May 95, Phil Yeadon shot this through the ether to All ...

PY> Does anybody know if a version of Word Perfect was ever released
PY> for the Atari. If it was could you please let me know where I could get
PY> hold of a copy.

There was a version of Word Perfect released. ISTR the last version having
come in about 1989-90. Version 4.0 if my memory serves me correctly. It was
quite buggy and was dropped soon thereafter. You'd have to find it second hand
somewhere. If all you need is something that will save files in Word Perfect
format, I can recommend Redacteur 3 which is available from FaST Club in
Nottingham. Good luck!

Cheers,
Tom

> The risks are lots of expensive damage. Its not too hard to blow SCSI
> devices.>

Any properly designed SCSI device should have enough buffering on its buss I/O so as not to be susceptible to "damage" from other SCSI devices...

Just hooking them up together shouldn't cause any physical damage... that's the whole point of a "standard" buss.

> As a remedy against signals running into each other, I could perhaps make
> the SCSI chain long enough so that the two CPU's signals won't reach each
> other only the devices between them.

Umm.. at close to the speed of light, the signals are going to reach pretty far, no matter how long you make the cables...

Actually, the maximum length of a single-ended SCSI buss (like the ST and Mac use) is something like 18 feet.

You HAVE to have the buss properly terminated, or the devices on the buss will likely not work well, or at all.

Having one host adapter at each end of the buss should work, as long as the boards have termination on them, and none of the other devices on the buss do.

Each device must have its own SCSI address, including the host adapters.. that's the really questionable area in this exercise, at least in my mind. I don't know if the ST host adapters can be re-addressed, and know nothing at all about the Mac end.

As far as both computers trying to access the same device at the same time, (or really, trying to access the buss at all, at the same time), that *shouldn't* happen as SCSI uses "buss mastering" to avoid just such situations. Only one buss master device can talk to the buss at a time. Other buss masters must wait until the buss is free before they can attempt to use it.

The problem is that the Atari ASCI port is NOT a standard SCSI implementation, and may not follow true SCSI buss protocols. Even with a "host adapter" board, it may not generate the proper buss request and buss grant signals.

I really don't know that much about the Atari ASCI port, but I do know that the Atari implementation of the VME "standard" left out those important functions... (I think the assumption was that the ST would be the ONLY buss master in your system, so the signals didn't need to be implemented).

Turning off one or the other of the computers on the buss *might* make it work better... IF... they don't use "active termination" where the device

has to provide the voltages to the terminator.

I'd say back up your hard drive(s) and give it a try.

2014. GEM Programming Questions

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-16 00:00:00 UTC
From: ee11cd@surrey.ac.uk
Message-ID: <3pb66p$fb6@info-server.surrey.ac.uk>
Source record: 26333

Hi,

I'm a final year degree student and I'm writing a D2D package for the Atari Falcon. So far I've managed to implement the record & playback sections (I'm writing the editing part at the moment), however I have a few queries:

1. When I 'm playing/recording a sound file I display a model dialogue box to prevent the user from accessing any other part of the system. The reason for this is that during simultaneous playback/record, the timing is very critical - therefore I cannot allow the user to perform any other actions. I display the dialogue using the normal calls, except I use evnt_multi() and not form_do() for user input. The reason for this is that I want to stop playback/record whenever ANY key or mouse button is pressed (anywhere). Unfortunatley if another program's window is open (such as XControl) when this dialogue is displayed and the mouse is clicked on top of the open window, then that window is topped, and my program doesn't receive the event. How do I prevent this - i.e. how can I display a system modal dialoguebox that waits for multiple events?

2. Also, how can I detect if either mouse button (or both) is pressed using evnt_multi() - If I use the value 3 for the mouse parameter it still doesn't work.

3. How do I implement cycling of windows (i.e. using the CTRL-W keyboard short cut)? How do I know which window is the one that should be topped?

4. This isn't a programming question, as I've finished the record/playback section (apart from the niggles above) - I was thinking of uploading it to an FTP site so that I could get feedback from potential users (this would look good in my final report). How do I go about this - I've never actually uploaded anything - however I do have full internet access. Secondly, which FTP sites would be the best to upload it to?

Please send any replies to : ee11cd@surrey.ac.uk
- or - Craig.Drummond@ee.surrey.ac.uk

Thanks for any assistance.

Craig.

p.s. When I've finished the whole project I may upload the thing (executable, C-Source code, and -maybe- my actual report) - is anyone interested in this?

I'm searching for a new 1Gb SCSI drive for my Falcon.
The following questions have arisen:

1. Is SCSI-II the same as FAST SCSI-II ?
2. Is anyone out there using an IBM SCSI-II drive(s) with their Falcon
(= do they work with a Falcon, are they good?)
3. Are Seagate Hawk drives really "second class" as some dealers say?
4. I recall once having a TOS-Magazin -program for testing hard disk
performance (with graphical output). If anyone knows the program,
please point me the ftp-site, or if you're really cool, uue it to
me. That program was the only one that gave a graph of the
drive's calibration interval & lenght, and that's something I have
to know before buing a drive.

Thanks.

Yes, after a few hours it gets hot enough to boil water (I put a few drops on it
and they sizzled!) and burns to the touch, but I've left mine on for a month with
no problems.

> users... :-)

All Macs generate parity, but IIRC prior to SCSI Manager 4.3 it was never checked. SCSI Manager 4.3 lets you enable/disable parity checks on a per-transaction basis.

[SCSI Manager 4.3 is in ROM for AV machines (660, 840 & PowerMacs), and ships as part of 7.5 for other machines. Other newer machines may have it in ROM, I haven't checked]

As I am sure he'll be along to tell you himself, Chris Ridd has done
a Lattice port of MiNT Libs (for Lattice v5.6, but it shouldn't make
any difference, I think).

The files are on CIX, I don't know where else he has uploaded them.

From: asx@ccnet.com
Message-ID: <3pdg0b$471@ccnet3.ccnet.com>
Source record: 26152

Hello.

I have Linux installed on my system along with X and while everything seems to work fine, I have been unable to use the SLIP correctly. My local service provider uses dynamic IPs and I wrote a small program that performs slattach, route, etc with arguments of local and remote IPs that I type in.

Now what happens is the when I ping my service host, I get 0% errors. When I ping ftp.phil.uni-sb.de I get 0% errors but when I ping micros.hensa.ac.uk, I get about 40% errors! And I cannot finger, ftp or telnet anywhere successfully.

I type ftp ftp.phil.uni-sb.de / micros.hensa.ac.uk / ccnet.com and what happens is that I get a "Connected .." message then nothing. I obtained a route and ifconfig output at this point and will be happy to post them (via email) for your evaluation.

Linux seems to be fairly stable on my system, I've got tcl and tk running, and Chimera and a buncha other stuff. Except for the GCC compiler which is probably missing some stuff.

Your help will be appreciated by all!

From: richwegner@aol.com
Message-ID: <3pe8lb$soh@newsbf02.news.aol.com>
Source record: 26156

Hi! Does anyone have a way to make a cable to make an external SCSI drive work with the ST? I posted a message asking of the one for the Mac was the same I found out it isn't, so can someone help me.

Here is my information:

1040STf (f, what does that mean anyway?)
1 meg of RAM (hopefully expanding to 4 meg soon)
720K floppy internal (standard)
360K floppy external (standard Atari)
Color & Monochrome monitors (with switcher)
No hard drive yet (that is why I need this information)

I need the kind of connectors locations, how to make the cable and other stuff that is needed. Also, if I got AHDI from an FTP site (I know where to get it), and I install it, will it work then with the hard drive or will that program only work with the MegaFile hard drives???

ANY HELP WOULD BE APPRECIATED. PLEASE SEND VIA E-MAIL!!!

It depends on the room temperature too. When I was down at 18 centigreedes
things worked allright, but at a more comfortable 21 centigreedes, dropdown
menus started to change if I was using a lot of midi interrupts. Proflight
just bailed out and crashed (no pun intended :-)

The ST's memory controller can handle 2 banks of memory, these banks have to be 16 bit wide (68000 has a 16 bit bus) so in a 1040 STf you will find 32 chips of 1 megabit (2 banks of 16 bits) But the memory controller can handle different bank sizes.

Possible combinations are:

512 k (2 banks of 256k x 16 bit)
1024 k (2 banks of 256k x 16 bit)
2560 k (1 bank of 256k x 16 bit and 1 bank of 1M x 16 bit)
4096 k (2 banks of 1M x 16 bit)

Only the STe had some minor dificulties in handling banks of different sizes but a small patch program solved that problem. On a plain 1040 STf there is no problem at all.

I guess that your 1040 STf has one bank of internal memory disconnected, and the XtraRam board fills this gap with 2 SIMMs of 8 bit, giving a new bank of 16 bit. Unless the board has two more SIMM sockets, there is no easy way to upgrade. If it has, then you will have to disable the other bank of the on-board memory of the STf too.

Really? Please give details. I am not 100% clear about the addressing modes, but I've never
had any major problems. The only bug I've found is that you can't have too many labels
starting with
the same character/s (probably some hashing algorithm bug).

I also think that DevpacDSP is good because it produce binary output and is quite fast.

Don't do this!!

The Atari ST does not have a SCSI port. It has an "ACSI" port (which
stands for "Atari Computer System Interface"). They don't call it
SCSI for good reason: it isn't.

To go from ACSI to true SCSI, you need a device called a "Host Adaptor".
ICD is probably the best choice for these with their "Link" product
line. This device has an ACSI plug on one end and a true SCSI, 50-pin
Centronics-style connector on the other. It gets power from the
TERMPWR line of the SCSI bus (pin 25).

> Also,
>does the 1040STf have a maximum amount for the size of the hard drive? I
>don't want to get one that is too big (if there is such a size). I can
>get drives and power supplies to make my own with no problem (I hope I can
>find SCSI drives with now with SCSI II and SCSI III out there too).

There is probably a finite limit, but it is more likely to be determined
by your budget. :-) I know there are people with 1-Gigabyte drives on
their Ataris. SCSI II drives are backward-compatible with SCSI-I. Don't
expect SCSI-II performance, though. The ACSI port maxes out at 10
megabits/second (1.25 Megabytes/second).

Good luck.

The last (latest) version of WP is 4.1, released in the spring of 1991.
That is, the last (latest) version that I know of.

But you need to copy your sprites arround dont you? And what about building
the screen (or are you planning to use a huge predrawn picture...)?

The Mega STe didn't have analog Joystick ports, as with the TT (?). I guess
that they were planing to dump them, until they made the Jagpad compatible...

< I have one shared drive - and I have it physically disconected from the computer not using it - when the other one is. >

Are you using a SCSI A/B switcher box, or do you yank the cables out by hand?

The overall concept is slowly crystalizing out...one SCSI chain, two computers, only one running at the same time, and a SCSI switcher box.

I may had some reason why I wanted both computers running at the same time, originally but I forgot what it was. (Darn. :-) Oh, yeah, I remember now! I wanted to run a MIDI sequencer on Atari, playing all those Sample Cell sound cards in the Mac. Oh well, I can run Cubase from a floppy just as well; I don't need a SCSI chain's worth of removable media for it.

Hi *

In <3pb66p$fb6@info-server.surrey.ac.uk>, Mr Craig P Drummond (ee11cd@surrey.ac.uk) wrote:
: Hi,
: I'm a final year degree student and I'm writing a D2D package for the Atari
: Falcon. So far I've managed to implement the record & playback sections (I'm
: writing the editing part at the moment), however I have a few queries:

: 1. When I 'm playing/recording a sound file I display a model dialogue
: box to prevent the user from accessing any other part of the system.
: The reason for this is that during simultaneous playback/record, the
: timing is very critical - therefore I cannot allow the user to perform
: any other actions. I display the dialogue using the normal calls,
: except I use evnt_multi() and not form_do() for user input. The reason
: for this is that I want to stop playback/record whenever ANY key or
: mouse button is pressed (anywhere). Unfortunatley if another program's
: window is open (such as XControl) when this dialogue is displayed and the
: mouse is clicked on top of the open window, then that window is topped,
: and my program doesn't receive the event. How do I prevent this - i.e.
: how can I display a system modal dialoguebox that waits for multiple
: events?

: 2. Also, how can I detect if either mouse button (or both) is pressed using
: evnt_multi() - If I use the value 3 for the mouse parameter it still
: doesn't work.
Unfortunately, it is _NOT_ possible to detect both mouse buttons at once (an
independent of each other !!!

: 3. How do I implement cycling of windows (i.e. using the CTRL-W keyboard
: short cut)? How do I know which window is the one that should be
: topped?
I think, you have to manage your own list for it. For instance:
- create a list of window-numbers
- every time a window gets WM_UNTOPPED or another window goes in front, the
first entry is moved to the last, the rest is shuffled up
- for CTRL-W you just shuffle up and display the window in toop of this list

: 4. This isn't a programming question, as I've finished the record/playback
: section (apart from the niggles above) - I was thinking of uploading it
: to an FTP site so that I could get feedback from potential users (this
: would look good in my final report). How do I go about this - I've never
: actually uploaded anything - however I do have full internet access.
: Secondly, which FTP sites would be the best to upload it to?
a.a.u.e.

: Please send any replies to : ee11cd@surrey.ac.uk
: - or - Craig.Drummond@ee.surrey.ac.uk

: Thanks for any assistance.

: Craig.

: p.s. When I've finished the whole project I may upload the thing (executable,
: C-Source code, and -maybe- my actual report) - is anyone interested in this?
YES, of course !!

Definitely not. Of course, since Atari is not manufacturing computers
anymore they might not really care but that's not for me to say.
Legally, it's still their intellectual property.

Yeah, they do discounts. Apparently, v5.6 has come down a bit, to
100 quid, or so I though looking in the new mag ST world. I think there's
a 30% discount for students, so that can't be bad!
I'm using Heat n' Serve C 1.4 at the mo'. I'm seriously considering
investing in this package, but before I do:
I have no Hard drive (and have been looking for cheap second
one for ages, with no joy); can the essentials of Lattice be stuffed onto
a ram disk and used from there, avoiding annoying diskswapping?

>
It depends on which mother board you have. Later 520 boards can be
upgraded with only the addition of chips. My 520 STfm which is marked rev
1.01, uses the sixteen pin 256k memory chips, in addition to adding
sixteen more of these chips I also had to add three rresistors. These were
marked R69 - R 71, and were located in a bank of resistors just below the
memory chips. To make sure your parts are correct simply compare the two
banks of memory, and follow the traces back until you find the empty
resistor positions in the new bank and the factory installed resistors in
the first bank. Hope this helps and thank you to all the people on the net
who helped me through my upgrade headache.

My Crazy Dots II card and its NVDI 3.02 software is a fast combination.
Very fast in mono -- blazingly quick, in fact. In color modes it's as
expected -- slower (since a lot of pixels are being moved around).

PS> I've heard you can use a dremel tool but no-one knows what this is.

I don't know about the adapter casing, but a Dremel tool is a hand-held drill, polisher, sander (i.e multi-tool) used by hobbyist and modellers. It (or an equivalent, there are a couple of others) should be available at any specialty hobby shop. IIRC they're not particularly cheap, but very handy little tools.

R > twisted)
R > to SCSI. If this is the case then I will probably buy one since that

Are you sure you weren't just looking at a 25 pin SCSI cable? SCSI comes in
two flavours, 25 and 50 pin.

From what I've heard the ST's ACSI port is a sort-of SCSI port. In order for
you to be able to hook up a SCSI device properly you'll need to get your
hands on some device that can translate SCSI to ACSI. The LINK, LINK II, or
ICD ADSCSI/+ are what are considered to be the best for the job.

Hope this helps...

Later...

What? That's gibbering nonsense. What are you saying ? The TT was first shown in October 1989, at around the same time as the standard STe *with* the ports. I think they didn't see the TT as needing them (silly really) what with being in a different, higher-end market, i.e. not games.

>
>S.Lai

So why didn't the MSTE have them... The TT, being a business oriented machine, did
not really need 4 joystick ports, but the Mega STE? This was a half way house...

Why include ports when there is no controller (over several years)? They simply
gave no benifit to the machine, until the Jagpad was released...

As I said before, I could be totally wrong...

If I understand you correctly, your Video player/recorder does not have direct audio/video outputs,you want to use the RF (normally connects to a TV) output to connect to your Monitor.

So you are looking for some sort of converter that takes an RF input, & outputs suitable signals for a microvitec monitor.

Try J. Bull Electrical or The Computer Discount Warehouse (adds in most of the UK electronics mags).

Personally, I would rather hack the Video player to get the signals , as the quality is going to degrade with RF conversions.

>Also, Magic forces my monitor to 50 Hz..

I think we went through this before, but maybe my reader is playing tricks
on me. Anyway, put Jar and Neoload in the auto folder, and rename
neodesk.exe to nedesk.prg. make neodesk.prg the shell. And use a 50-60HZ
util to switch to 60HZ in the autho folder right after the magic booter.

Hi Chaps,

I have the following for sale

Atari Mega STE
4 Megs Memory
50 Meg Hard Drive
1.44 Meg Disk Drive
TOS 2.05
SM 144 Mono Monitor
Keyboard
Mouse
Joystick

Excellant condition

Sensible offers considered.

Prefer a buyer in the Hampshire or surrounding area. Must collect and
would perfer cash.

email sis3468@anubis.sis.port.ac.uk

2086. 1040 power supply fix?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-19 00:00:00 UTC
From: robh@epunix.susx.ac.uk
Message-ID: <robh-1905951628000001@robh-quadra.biols.susx.ac.uk>
Source record: 26108

I guess this must be a pretty common problem since nearly all the people I know with Ataris have had the supply go down at some stage - well now it's happened to me:-(I can usually fix these kind of things but I *hate* fixing switched-mode ps's. Anyone have any clues? Alternatively (UK) anyone have the address of the place near London Bridge that exchanges them?

thanks
rob.

Actually , I am working on 3-D type stuff, so I have to build the screen on
the fly using calculations. With scan-line algorithms, you have to pretty
much calculate each scan-line as you go. This is why I am asking if the
blitter will help here.

>> still doesn't work.
> Unfortunately, it is _NOT_ possible to detect both mouse buttons at once
> (an independent of each other !!!

Actually, it _is_ :) but it is not as far as I have seen been documented
anywhere (correct me if I'm Wrong).
What you have to do is set the 8:th bit of the num_clicks parameter (i think it
is the first and then wait for the buttons to be _up_ .
what you actually are doing when setting the 8:th bit is that you are telling
gem to make an NOT on the result of the evnt, thus making it look like this.
NOT(MO_RIGHT AND MO_LEFT) and if you do some boolean work with it :) it will
look like this.
(NOT MO_RIGHT) OR (NOT MO_LEFT) and this is also the reason for that you have
to wait for the button to be released instead of to be pressed.
This is the way you should use it if you are programming in C.

```
evnt_button(0x102,MO_LEFT|MO_RIGHT,0,&mo_x,&mo_y,&mo_b,&kb_status);
```

Hope this helps, if not try it out and you will se that it works.

>No hard drive yet (that is why I need this information)

Not only do you need a hard drive, you also need an adaptor depending on
which hard drive you're going to get. And then you need the cable ofcouse,
but if you chose to buy a SCSI drive, there is several adaptores out there
on the market for this type. And when you got this + your drive, it's no big
deal to buy a cable as well.

>
>I need the kind of connectors locations, how to make the cable and other

Ahdi will let you controle Scsi or IDE drives. You could get an Megafile,
but these drives are all MFM, and therefore not available as new any more.

>I'm searching for a new 1Gb SCSI drive for my Falcon.
>The following questions have arisen:
>
>1. Is SCSI-II the same as FAST SCSI-II ?

Yes and no. SCSI-II is a set of commands and ONLY a set of commands.
FAST SCSI-II is a drive like the "normal" SCSI-II drive, but got some technical
commands for internal use. There's also WIDE SCSI-II and the latest SCSI-III.

A "normal" SCSI-II drive and a FAST drive are both compatible with each
other, (though some internal stuff wouldn't work ofcouse). Some people claim
a FAST model is faster, but i doubt that. Specially on the Atari you wouldn't
know the difference as Tos can max go up to around 1.8Mb/s

>2. Is anyone out there using an IBM SCSI-II drive(s) with their Falcon
> (= do they work with a Falcon, are they good?)

Sorry no!

>3. Are Seagate Hawk drives really "second class" as some dealers say?

It's probably "second class" if you compare it to the SpitFire model, but
i guess the Hawk is good enough for most issues.

>4. I recall once having a TOS-Magazin -program for testing hard disk

I think i recall what program you're talking about. And if thats the one
it doesn't work with Tos 1.6 and above. (Don't know if it'll work with
Tos 1.4). And it gave wrong results as well.

You have to first find a *compiler* that supports 8 byte doubles, and
Sozobon is not one of them, it has sizeof(double) == sizeof(float).
Without compiler support you won't be able to use such a library. GCC
together with the MiNTlib does support 8 byte doubles (i.e., IEEE
double float).

2099. GCC Cross Compiling

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-20 00:00:00 UTC
From: dancer@nntp.brisnet.org.au
Message-ID: <1995May20.124143.28865@nntp.brisnet.org.au>
Source record: 26118

I had a few recent hardware problems which resulted in my no longer being able to run gcc on my local system. I've been offered the use of a slew of system resources, in the form of a 486 linux box (or at least a login and the right to consume a few gig of space (:) so I thought "Great! I'll drop a gcc cross compiler on there and no problems!"

Hoo boy, not thinking was I?

gcc 2.6.3 compiled without a hitch using --target=m68k.atari.sysv4 and produces lovely m68k assembler output. All that remained was to get gas and ld.

gas-2.3.2. Fine, I thought. That will do nicely. Grab, and fiddle. No, this version doesn't understand the target: m68k-atari-sysv4. It _does_ understand m68k-motorola-sysv4, though, so I tried it with that.

Okay. It chokes on the assembly code that it gets from gcc. Lessee, there's a note in here that says that later versions of gas are in with the binutils. Back to the ftp site. What's here? 2.5.2? Hmmm...anything later? It seems not. Grab that then, and find something to do for an hour while I wait.

Finally, it's arrived. Unpack, run configure with --target=m68k-atari-sysv4 and LO! It _knows_ the target! And then WOE(!) it tells me that ld doesn't know the target. Gas, however runs on a seperate configure to the rest of the package so I try with that. Magic. It accepts the target.

I do a make. Fine. I go back to gcc, and 'make' again with as in the current directory to handle the generated 68k assembly. Choke. Same thing.

All the versions have complained (a) that they don't know the commandline option 'Q' or 'y' (g?) and they bitterly hate all the assembler directives (.section, for example).

Is it something that I'm doing wrong here? Have I missed some simple thing that causes gas to fail to recgonize the commandline options and preprocessor directives that gcc is giving it?

Do I have the wrong 'gas' verision...hell I've still got to get ld compiled and running too, don't I?

All assistance appreciated, email me and avoid spamming the list users, if you like. This linux news server is a touch twitchy.

Dancer

2101. How to connect High Density drive on Atari TT

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-20 00:00:00 UTC
From: arnoud1@xs4all.nl
Message-ID: <arnoud1.2.00768445@xs4all.nl>
Source record: 26120

Hello all,

Who can answer the following question for a friend of mine?
The Atari TT has a connector for an external diskdrive. He has
connected a High Density diskdrive to it: it can read HD diskettes, but
not Write them.
Amongst the pins of the connector no pin seems to be reserved
for the control signal of a HD drive. However, he has been told that the TT
should be able to support High Density disk drives. Does anyone know which
'connection-point' in the computer supplies the High Density signal? Where
should he connect pin 2 of the Shugart standard?

Hope some Atari-wizzard can answer this question.

Thanks in advance.

Does anyone have information on the layout of the Atari 1040STf internal workings? My father wants the instructions on upgrading my 1040STf to the full hilt of 4 megs of RAM. Also he wants to know where you can obtain the chips to get the upgrade done (in the US).

In another related question, I have TOS 1.2, is it possible that anyone would know if any TOS version above 2.0 would work on the 1040STf? Also, what is the highest that would work. Lastly, where can one get a TOS chip to install too.

The ST506 is a previous standard to SCSI. You might well have an
ST506->SCSI adaptor. If so you can pick up a cheap ST506 based drive and
make it into a SCSI one AFAIK.

> What do I do? (I know, buy an ICD host adaptor.....)

Yup - as you still need a way of connecting the SCSI drives to the Atari.

:-)

Roland.

@CiX

PS AFAIK ST506 were the first standard of drives used in PCs. They had two
data cables as opposed to the single one of the later IDE and EIDE ones.
They weren't very big - and were quite slow.

>(What is an ST506 anyway? some sort of non-embedded SCSI drive I presume?)

ST506 was the interface used on the original IBM XT. You might be able to
find a drive from one of the advertisers in Micro Mart, however, if I was
you I'd get a host adaptor, eg. ICD Link, for the SCSI drive instead.

From: bravdaun@rs6a.wln.com
Message-ID: <3pk2qm$d9g@calliope.wln.com>
Source record: 26127

Howdy, it has been years since I have been in ST world, I am trying to convert all of my DEGAS format pictures to GIF so I can use them in the IBM world. If anyone knows of such a utility please e-mail me an FTP address or www url. The best picture utility I have on the Atari is Pic Switch 7! (I think that is around 5-8 years old, there ought to be something newer that does GIF conversions.)
Thanks for your help!

Its almost certainly of no use to you. :-(

You need a host adaptor in order to connect SCSI devices to your ST. The ICD Link and ICD Link2 are quite popular models - but cost best part of 100ukp which is well over $100 US.

> drive with the ST. Also, does the 1040STf have a maximum amount for
> the size of the hard drive? I don't want to get one that is too big

The limit depends on the driver software AFAIK. A few hundred Mbs should be no problem - but if you want a Gb or so - then things get slightly more complicated.

> with SCSI II and SCSI III out there too). Any help will be

You shouldn't have too much trouble with SCSI2 drives. Ones thing to watch out for is parity. Many Atari host adaptors can't cope with parity - and some more modern drives don't have a means of disabling it.

:-)

I don't know if this has been asked before, but what would be involved in making a little black box that would allow you to plug a PC serial mouse into the ST mouseport? Has anyone ever done it? Is there docs for this hack somewhere? Or does it already exist? I'm not interested in pluggging a serial mouse into my serial port because I only have one and it's constantly being used by my modem. I assume it is possible, and could be about the size of a MouseMaster or even smaller. Any info would be greatly appreciated.

2112. Falcon I/F layouts

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-21 00:00:00 UTC
From: richcsst@crash.cts.com
Message-ID: <D8xHE0.FKA@crash.cts.com>
Source record: 26131

Does anyone have any data on the Falcon's internal memory and Processor direct sockets? I have tried to get a hold of someone at Atari to return my calls (it seems voicemail is all they know). I would be most grateful for any replies. Heck, I'd be glad to purchase a developers kit, but Atari won't even speak to me, or even write a letter to me saying "get lost".

Does anyone know of a phone number (preferably USA) where I can talk to a human instead of a machine at Atari???

Thank you in advance,

Rich

P.S. Photocopiers are such wonderful machines....hint...hint...

The MegaSTE was, in essence, planned as a "poor mans TT". It's release date about six months or so after the TT, in a "TT clone" case, emphasised this. Port wise, it lacked only one of the four serial ports and the SCSI port. it retained the LAN, MIDI, audio-out, VME, cartridge, printer and ACSI ports. (The serial ports, however slimmed down from 25-pin to 9-pin).

As such, the emphasis was on serious software and hardware. Games themselves were not envisioned to be used on the MegaSTE.

The analog ports would have been useful additions, however.

2114. Games & Graphics Programming

Hmm, for Intel processors this is quite normal, but for Motorola ???
My 68030 in the TT gets about 30-40 degrees and it's running 32 Mhz, I
guess the 16 MHz processor in the Mega STE isn't a real 16 Mhz one or is
not Motorola... Anyway, a small heatsink may solve the problem.

>fixing switched-mode ps's. Anyone have any clues? Alternatively (UK)
>anyone have the address of the place near London Bridge that exchanges
>them?

The switched-mode ps of an Atari is quite simple to repair as it just
consists of a few parts. First check if the power transistor hasn't got a
short, normally if it has, the fuse is blown. Replace the transistor and
the fuse and try again. If the fuse isn't blown there are a few possible
parts which may have died. There is a 'start-up' resistor connected to the
rectified mains voltage and the base of the power transistor. This is
usually a somewhat large (size) resistor of 100k to 500k or so.
If this resistor is broken (infinite resistance) then there is no load on
the large capacitor(s) and they will hold about 300 volt for quite some time,
so please discharge through a resistor of a couple of hundred ohms first!!
Replace the defective 'start-up' resistor and ten-to-one the ps will run.
Another part which can be defective is the 'run-in-surge-protector'
resistor which is just a couple of ohms and it's connected in series whith
the mains lines, it can also be some sort of NTC resistor (round shape with
two legs at one end) check this one out and if it's defective check the
power transistor for a short too.

Good luck and beware of them high voltages !

>difference between the STE high and TT medium resolutions?
>
>Thanks in advance :-)

If you'd use NVDI on a TT Hi monitor the scrolling is quite acceptable, but who needs scrolling on a 160 columns & 60 line screen :-) With NVDI the writing to the screen is blindingly fast, so page flipping is much better than scrolling..

The screen size is 153 kbyte so the screen memory is not larger than the TT-medium screen.

As for the monitor, I used a Viking 1 (Moniterm) with some minor adjusting (and creating a cable, which was fairly simple). These monitors are usually dumped by some companies after their upgrades to color systems, try some CAD or DTP company, maybe they have some in the basement gathering dust...

[snip]
> (What is an ST506 anyway? some sort of non-embedded SCSI drive I presume?)

An ST506 drive is as follows :
Seagate
Technologies
5 1/4 inch
06 megabytes unformatted

I might be wrong - it could be an 8-inch drive - havent seen one for aeons

All Seagate drive names can be broken up in this manner :
ST = Seagate Technologies
x = Form factor of device
1 = 3.5 inch Half height
4 = 5.25 inch, full height (?)
5 = 5.25 inch, full height (?)
9 = 2.5 inch, (Half height?)
yyy = _Unformatted_ capacity
(This may be followed by A, N, R or some other single letter)
N = SCSI
A = AT-Bus (IDE)
R = RLL

(There was a text file available a few years ago which documented this,
giving many more values than I've written above - purely from memory -
but, unfortunately it has since become a tad lost/destroyed/invisible.)

The ST157N in my TT is a 3.5in, half height, 57MB unformatted SCSI.
The ST5065 in my Megafile60 is a 5.25 inch, half height, 65MB unformatted.

Unfortunately, I can't recall any other drive manufacturer sticking to
this, or any similar naming scheme. A pity - it really does make it
easier to know what a drive is before even seeing it "in the flesh".

>'connection-point' in the computer supplies the High Density signal? Where
>should he connect pin 2 of the Shugart standard?

>Hope some Atari-wizzard can answer this question.

The TT has no signal availiable on the 14 pin din connector to
detect the HD signal from the external floppy.
If you are into a little bit of home hacking you can make the TT
accept the signal. Pin 6 is defined as Drive 1 select but it
is connected to ground and not used. Cut the trace on the TT mother
board and connect Pin 6 to the internal 34 way floppy connector
at pin 2.

hope this helps

I tried this last year - unfortunately I got myself a summer job and the
programming sort of went out the window!

Anyway, get a copy of The Atari Compendium - everything you need to know,
basically. It has details of all the OS calls, a complete memory map, and
lots more... Also worth a look is the Modern Atari System Software book,
a little more Falcon-specific, and only covers the new calls, but it's
helpful to have both so you can read two different explainations! :)

Both are from HiSoft.

Good Luck!

Neil.

The MegaSTe was a double-speed ST in a TT case. Simple. I reckon they couldn't be arsed to find space for the extra two ports. Where would you have put them? Also if you had seen any of Atari's promotional material (no smart comments please) you'll see that the MegaSTe was also aimed at the pro market, although a halfway house, as you say, it was halfway in that direction.

: > Hi,
: > I've got a hard disk host adaptor for (it says on the PCB) an ST506

: The ST506 is a previous standard to SCSI. You might well have an
: ST506->SCSI adaptor. If so you can pick up a cheap ST506 based drive and
: make it into a SCSI one AFAIK.

Sorry, I should have made this clearer - the thing I have is an
AHDI->ST506 adapter (I bought it recently, mainly for the box and power
supply).

So (Next question) where can I get a ST506 compatible drive from? I've
had someone tell me that these are also known as MFM or RLL drives.

Thanks for everyone's responses so far!

YES! HD access is several times faster with 1.04/2.06 and a HD crash isn't
that likely.

RJ> to me saying "get lost".

Forget the Developer's Kit-it's overpriced for what it is.
I was considering the DK a year ago, but several developers and hobby programmers told me that the DK was mostly xeroxed texts that weren't even indexed! I have heard since that they include the Atari Compendium. I think the price is around $300. For that you could order Lattice C 5.6 which is more or less the standard Falcon C kit or Devpac 3 which is for Assembly Language.

Two excellent reference books are Modern Atari Systems Software (by Hisoft) and the Atari Compendium by Scott Sanders. Both can be ordered from your Atari dealer, or you can send for the Toad Computers catalog. What language do you use? Hisoft makes excellent commercial Assembler,Basic and C packages. If money is tight, I would buy the two above books and get GNU C which is freeware on most Atari BBS's. (Freeware)

2133. MH-MiNT 1.12h3 and MiNT-Net 0.70

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-22 00:00:00 UTC
From: Stephen K Mulrine <robotron@moroder.demon.co.uk>
Message-ID: <199505221850.AA03775@moroder.demon.co.uk>
Source record: 26202

MH-Mint 1.12h3 doesn't like me having my MinixFS and MiNT-Net drivers in C:\MINT (unlike 1.12h2), so I moved them to C:\ and it appears to load them fine. However, my MiNT-Net interfaces are not being loaded. Previously I would see a message that 1 Ethernet, 4 SLIP and 4 PPP channels were available, but now it only says "Loading interfaces:" and goes on to load the MinixFS driver. Also, "ifconfig -a" under 1.12h2 would give a long status report for all my channels, but under 1.12h3 it only reports back for "lo0" (which MiNT-Net presumably provides by default). Is there somewhere I should be putting my .XIF files to ensure they are loaded, or does the problem lie elsewhere?

Stephen

From: T.R.Pearce@shef.ac.uk
Message-ID: <3pr5i6$ctv@hippo.shef.ac.uk>
Source record: 26205

Having just disassembled my falcon to remove the internal
speaker I found a whole load of unused internal connectors.
Can anyone tell me what they are for?

U46 and U47 : Internal jumpers
Profile correctly reports their states but what do they do?

W11 : jumper on small internal expansion port
Again what does it do. Is it merely to determine whether there
is anything on the port?

W10 : jumper by RF modulator
What does it do. Is it to do with PAL/NTSC sync rates. I know
can also be changed in NVRAM.

P6 : IDE interface
will this support 3.5" enhanced IDE drives (with suitable cable
and new case, of course). What sort of speed can I expect from
such a drive. Will it be able to play back 8 tracks of D2D? Atari
World issue 2 quoted 1.4MB/sec required for this.

2 spare pins on keyboard connector
What are they for?

AND : How do I extract the Modem 1 (device 6) from the MFP chip?
Does anyone have a pin out for this chip. If my falcon is in a
new case I will want to use this port to connect to PC using
Ghostlink or similar, but like my PC mouse in the current Modem2
Port.

If anyone can help me with any of the above questions I would be most
grateful. Please e-mail me or leave replies here.
Many thanks,

TIM (a troll)

2137. I sure love asking questions

I sure love asking questions about the Atari ST on here and it is nice to get responses. I have some more for you all techies on the ST.

My Atari 1040STf floppy drive just went kind of dead. If I move the disk around inside by moving it slightly it reads it, but when I just put the disk in it doesn't. I was in the middle of copying files from one floppy drive to the other one and it happened while I was using it. I tried shutting off the computer and trying it on again, but it won't work. HELP!!! Is there a way to put the external floppy inside the ST and make it work?

Also, here is another one. Does ANYONE in the UNITED STATES have the diagrams of the 1040ST? I want copies (will pay for them) of the inner workings, including chips and keyboard and other stuff on the inside. Any help would be appreciated.

Hi everyone!

I have a question for the SCSI-wizzards out there.

I have a Conner 1060 MB hard drive connected to my Falcon and
it's been working fine since I got it. One day I was going to
change the SCSI ID on it, but since I didn't have the manual for
it, I just tried to put the jumpers in different combinations.

I guess that was a bit stupid, cause now it won't start. Well,
it starts but just as the drive starts clicking, it shuts it
self down again. It identifies itself correctly as SCSI 0, but
the driver then gives a _Drive_Not_Ready_ message.

Does anyone know what I've done and how to correct it. I have
come to think that I have put it in some test mode or something,
but I haven't really got a clue.

Can YOU help me?

Thanx!

/HUGO.

Tony

Yes this should work just fine, if you plug a 5 1/4" dirve onto the ST
as a second disk drive and set it for drive b (1).

The ST unlike the PC does read the disk info and should hence set
itself up for the single sided disk. You should be able to read AND write
in this format. If you have the correct formatter you should also be able to
format 40/80 track single sided.

The only problem you might have is the step rate of the 5 1/4 drive
and you may need to use one of the acc's to set the rate. I did also have some
problems getting the ST to recognise the drive if it was not at track 0 and
still think that it only had one drive.

Another idea if you still have the PC is to use GhostLink and hook the
PC to the ST. In this case the ST can access the PC disk, the PC sorts out the
reading of the disk.

Best of Luck
Mike Wilsher

James Hess (jhess@orion.oac.uci.edu) wrote:
: I need to know if the Atari SMM 804 printer uses standard ascii code and
: the same cable as an IBM-compatable printer.

Of course the SLM printer supports standard ASCII. That is why it is called
standard. The cable is quite a different story. If I'm correct, the SLM
laser-printer is connected to the harddisk-port.
I am not sure if the SLM printer has a centronics-port.

But It must be possible to connect another laser-printer to the centronics
port. After all, at the office I have an HP laserjet connected via
a standard Centronics cable...
Thus, it must also be possible to connect the HP printer to the Centronics
interface of the Atari computer.

: I tried this question before and have received no replies; perhaps if no
: one knows the answer you could tell me if there is any technical help still
: available from Atari and how to contact them?

Any Atari dealer in the world should be able to help you with this.
I am just a user. Not an expert. So before you start spending alot of money
or something... check it with a dealer. Just in case....

The German shareware program "Connect"; without a doubt!!!
It might seem a little complicated at setting up at first, but once you've
gotten to learn the basics you'll never want to change- has some very advanced
features and is absolutely worth the price asked. You even get a printed
manual.

This might happen when the keyboard is disconnected (on a Mega or TT) or in
in your case the keyboard is broken or a key is borken (always pressed) or the
cable that goes from the keybord to the motherboard is down. Open your St and check the
connections.

> into the ST mouseport?

This can already be easily done, with no hardware adapter needed.

A standard MicroSoft compatible serial mouse can be used in the regular
ST mousport, but it needs a software driver.

DMC Publishing, out of Toronto, sells such a driver, and it's my understanding
that a similar driver is available for ftp from atari archive sites.

A standard PC *bus mouse* can be used with no software drivers needed,
but some slight modifications to the wiring of the connector are needed.

There should be text files telling how to do this on the atari archive sites,
and I know we have them in the Atari Forum on CompuServe.

You should use wind_update() for this.

|> and my program doesn't receive the event. How do I prevent this - i.e.
|> how can I display a system modal dialoguebox that waits for multiple
|> events?

Use wind_update() - this prevents other applications recieving events.
wind_update(BEG_MCTRL);
.....code
wind_update(END_MCTRL);

|> 2. Also, how can I detect if either mouse button (or both) is pressed using
|> evnt_multi() - If I use the value 3 for the mouse parameter it still
|> doesn't work.

There is a hidden kludge, which I cann't remember offhand (I use it in CLAv3). One problem which hasn't been mentioned is that this kludge, although it works on all TOS versions, does NOT appear to work with MagiC. The other approach is to use graf_butv() to hook a patch into the mouse button handler (this is the way the Lattice C manuals say to do it). This will prevent WinX working properly though....

|> 3. How do I implement cycling of windows (i.e. using the CTRL-W keyboard
|> short cut)? How do I know which window is the one that should be
|> topped?

Keep a list of your windows......every time one is topped, send it to the back of the que. ^W takes next window from queue.

Hello out there. I own 2 Sts, a 520STFM nd a 1040 STE and I recently bought a 2nd hand 2400 Fax/Modem. I have the splitter cable consisting of a 9-pin and a 25 pin connector which fits into my Rs-232 socket. However, it will not run. I do not know how to run the VT-52 Emulator <it just sits there>, and i have a copy of the ST Format BBS setup and it won't run on that either. Could there be a problem with the HAYES standard because the software is sending these wierd init strings that I can only decipher as being custom strings for that software.

If anybody could help me, I would also like some pointers on other software to use. I am looking at Vanterm. Is this adequate. And anyone within Australia could you please answer this question for me......

Who is the better server for Internet access: Ozemail or Compuserve Pacific?

Darned if anyone can answer that that I know!

Insomnia is gaining and I cannot steer it's path. I am extremely frustrated.

Please help me.

>So how else can I speed it up?

Such things will be included in future version of Backward III.
Just a few explanations: Backward III is a RESET proof TSR, so
after the first cold boot, it is kept in memory; i.e. you'll have the logo
and the slow boot once, and then all subsequent warm reboot will
be logo less and/or IDE test less.

Last thing, BACKWARD III is released since a week and will be
soon uploaded on various ftp sites.

I have an external ST296N (80 Meg Seagate) attached to my MSTE. It was formatted with the Atari HD utils, using the XGM scheme, then a couple of partitions were converted to OOP type. Since I've pretty well given up using Spectre, I'm considering the possibility of recovering the space in the OOP partitions. Is it possible to use Diamond Edge (or some other software) to convert the partition type or would I need to reformat the drive, or what?

Thanks for any advice,
John

I have a 18" ProScreenTT which I believe is a badged Philips monitor.

I also have a 15" Princetron LM301(?) which isn't a patch on the ProScreen
but does do the job. The Princetron was being sold of in the UK last year
by a surplus dealer at between 15ukp and 25ukp(!) because as far as they
were concerned it didn't fit anything. It needed a new lead and a few
internel presets tweaked - but that was all.

:-)

Roland.

2177. Wanted: ST Multitasking info

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-24 00:00:00 UTC
From: ppospis@mtroyal.ab.ca
Message-ID: <1995May24.225726.4957@mtroyal.ab.ca>
Source record: 26004

I have a 1040 ST with 4Mb of RAM and a HD with sufficient free space.
I have been running the standard GEM desktop for a long time and am
now tired of single-tasking, i.e. finding something else to do while
I download, etc.

I have heard of a number of possible multitasking solutions: MultiTOS,
Geneva, etc. I would like more details about these before I do
anything. Some of the things I am interested in are:

- how stable is it?
- does it still support GEM/TOS or will it allow booting to
either GEM or it?
There are a number of programs I would like to continue
using.

Lastly for anything that is not PD/Shareware could you tell me the
manufacture/distributor if you know. There are no Atari suppliers
in Calgary.

Thanks

2178. TT speed up project...

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-24 00:00:00 UTC
From: gert@ttgk.nextjk.stuyts.nl
Message-ID: <Up-FEYWFBUQ@ttgk.nextjk.stuyts.nl>
Source record: 26005

Hi,

I wonder if anyone has tried this before:

In the effort of making a 'fast' computer faster:

Yesterday I tried to make my TT run at 40 MHz so I connected the clock input pin of the 68030 to the output of a 40 MHz oscillator. After powering up I found out that the whole system came up OK but only up to the point where the desktop should kick in. Auto folder programs run fine, booting is no problem. After some fiddling around I found out that if I connected the 40 Mhz oscillator in place of the original 32 MHz one, the desktop came up fine, only all other frequencies are too far off, (e.g.the serial port of the keyboard) so I couldn't test anything else. The video frequencies also went up a bit (I got a nice steady 640x480 at 75 Hz !!)

I know there is a TT speed up called CaTTamaran, but what does it consist of ? (this CaTTamaran makes the 68030 run at 48 MHz)
Anyone knows which parts should be running 'in sync' with the processor clock?

BTW, what does a real 68030 @ 50 MHz cost nowadays (the 68030/33 get's 'quite' hot when running at 40 MHz)

Another thing I tried was the old 'overscan' trick of the ST, that is, disconnecting the 'DE' (display enable) line of the video chip, this resulted in a full screen pixel filled picture so I guess with some work it should be possible to get more than 640x480 on a standard TT.

And before someone calls me nuts for butchering around in my TT, I did it with an 'old' TT board coming from Atari Computers in Holland. They offer 5 TT boards for 200 dutch guilders for anyone interested... Most of these boards have all the chips on them, including FPU's, Eproms etc. But none of the add-on boards like ST-RAM extension, TT-RAM etc. These boards are 'written-off' repair boards.
I already got one board up and running (I added an old ST keyboard and a PC power supply, a PC HD 1.4 Mb floppy and after some minor repairs on the board it runs just fine now)

Gert

I've not used tcc <move> <parallel move> but I've used tfr <move> <parallel move>

Don't forget that you must put your parallel moves in the correct order for the assmebler, i.e X: Y: and you canonly use the correct address registers for the move.

I always use binary files, and they seem to work fine so I can't really comment on the LOD problem although when I have used them they seem to be fine.

THE KEY TO ORGANIZING YOUR HEALTH RECORDS

"If you care about yourself and your children, you will do everything you can to know your family's medical history. It can save your life, and the lives of those who are dear to you." -- Dr. Aubry Milunsky, Director, Boston University's Center for Human Genetics (Life Magazine, March, 1995).

Your Lifetime Health Planner offers the simplest, most effective way to take charge of your health. Enter important facts about your health history, keep a record of the names of medications and their effects, document each doctor visit and diagnosis. You will have the information you need, and in the event of an emergency, so will your family.

Your Lifetime Health Planner, 198 pages in a compact, loose-leaf binder, contains a variety of sections which include "Doctor Visits," "Medications," "Family Health History," and "Doctors and Specialists." The Planner is a must for the busy executive who needs to stay organized, for seniors who are receiving care and for newborns who need a record of their health care.

Parents Magazine recommended the Planner to its readers (April, 1994) and MCI called it "a useful resource in managing your personal health records." Margie Smotherman, Coordinator, Employee Health and Wellness, Blue Shield/Blue Cross of Iowa, said: "The employees felt that these (Planners) were great tools to not only record their pertinent numbers, but to plan for doctor's visits."

To get your copy, send a check or money order for $19.95 (plus shipping and handling) to :

> I'm looking for a good terminal program that handles VT-100 or VT-102

The standard answer is Uniterm (free) or Connect (looks professional)

> Also -- what are the patches to run a 14.4k modem on an ST?

You don't need any, your modem will be able to use 19.2k between modem
and computer.

> by hand?

I yank the cables out by hand.

What I have is a drive cabinet with an ICD AdSCSI+ inside and a hard drive.

Back in the dim and distance past - they were actually connected together
with a short length of ribbon cable. ;-)

Now the drive is part of a larger SCSI chain - as has a 50 Way centronics
female at both ends of its cable. The AdSCSI plus has a cable terminating
in a 50 Way centronics male plug.

If I want to use the drive with the STM, I connect the centronics male to
the 'in' centronics female. If I want to use it with the TT then I connect
the TT's 25 way 'D' to 50 Way centronics cable to the 'in' centronics
female.

In either case the 'out' centronics female gets connected to the rest of
the SCSI chain - which ranges from a passive terminator - to a couple of
drives and a CD-ROM, depending on what I am doing.

Seems to work quite well, though initially I was getting <sense> errors
via the AdSCSI+. Shortening the cable between the AdSCSI+ and the 50 Way
centronics male cured this (though I'm pretty sure it was a crosstalk as
opposed to cable length problem).

> The overall concept is slowly crystalizing out...one SCSI chain, two
> computers, only one running at the same time, and a SCSI switcher
> box.

Should be okay - though a SCSI switcher box is not actually necessary if
you don't mind switching conections like I do.

:-)

Roland.

```

As long as you have NVDI and preferably a mono' monitor as well. (Although, I've found a GDOS font that works perfectly well in medium resolution!). But using anything about 2400 baud with a GEM-window based comms program, without NVDI or some other screen accelerator is quite unpleasant! :)

STorm seems to crash quite a lot, so I gave up on that. STalker from what I've seen is brilliant, but on this setup at least (for reasons neither I nor Dan Wilga can think of) crashes a lot (I think my machine has a defective blitter or DMA chip or something). As long as you don't need heaps of features, Uniterm is well worth a look, it's stable, quick, and has arguably the best VT100 emulation of any program on the ST.

FZDSterm has heaps of features and is IMHO simple to use, but forget about trying to use it for VT-100/VT-102, it can't cope.

Connect, Uniterm or STalker would be your best bets. Connect is shareware, and disables itself after 30days. Uniterm is (IIRC) PD, and fully operational and STalker is commercial although there's demos of it on most major Atari FTP sites!

Best places to look

atari.archive.umich.edu in atari/Telecomm/
(ftp://atari.archive.umich.edu/atari/Telecomm using WWW/Lynx)

If it's not there, you'll be ahrd put to find it elsewhere :)

Try STarCall, vt 52,100,200,220 & ANSI... built in editor & buffer.. can use
'full' screen (as per flash 1.6) or terminal window.. It's fully
functional shareware with 10 second shareware fee reminder dialog....
ver 2.0E is now available which is in ENGLISH.. a few problems on TT's but
is great on ST's..

Ver 1.8G is available on some FPT (I think ftp.cnam.fr or ftp.uni-kl.de)sites
& ver 2.0E from a BBS in Germany Phone GERMANY 02363 2610

Try it you'll love it

I want a terminal program for the atari portfolio to communicate with my
modem.
Is there such a program to do that (via the portfolio interface).

please email to: geheniau@solair1.inter.NL.net

2192. Megafile 30 settings

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-25 00:00:00 UTC
From: seldin@alcor.concordia.ca
Message-ID: <seldin-2505951839540001@fp-math-39-237.concordia.ca>
Source record: 26011

Does anybody know how to change the device number setting on a Megafile 30? If not, does anybody know where I can find out?

I have one whose last use was for Macintosh partitions under Spectre GCR on a TT, where it was ASCI device 0. I now want to use it for extra hard disk space on a Mega4 which already has a combined unit consisting of a 40 Meg fixed hard disk (device 0) and an 88 Meg Syquest drive (device 1), so I want to reset the Megafile to device 2. I am using ICD Pro hard disk utilities, if that information is relevant.

(I think this was asked before, and I apologize for wasting the bandwidth, but I have not been able to read the news consistently this spring and I may have missed the information I am seeking.)

If people send me e-mail, I will summarize to the net.

You could also try the excellent shareware Teddyterm, AFAIK it runs VT and
ANSI modes. Colour or mono; Colour display is same as the mono except for a
few coloured dialogs and things, tho it will display colour input. Simple
and effective.
It used to be on ftp.demon.co.uk in pub/atari/comms, I think.

Sorry, my new server has "more included than new" syndrome - it's a bloody
nuisance.

: up using Spectre, I'm considering the possibility of recovering the
: space in the OOP partitions. Is it possible to use Diamond Edge (or
: some other software) to convert the partition type or would I need to
: reformat the drive, or what?

I did something like this as well, except using the ICD utils. Basically, I just changed the partition type identifier from OOP (or maybe it was ACK) back to GEM (small partition), and rewrote the partition info. Probably foolish to do without backing up, but it seemed to work. Of course, I could really tell, since I immediately switched it over to a Minix partition.

I am also looking for a ANSI BBS comms terminal program.
I tried ANSITERM 1.9, which is quite good, and TAZ-1, which bombs after
sometime of usage. Is there any others great ANSI terminal program out there?

Hi,
I have a friend (would You beleive that ?) who has an Atari Mega STE.
He has a birthday coming up monday May 29, and I thought I'd try to
get a package together that would connect his Atari with a SLIP
provider. My question is:

What software should I collect and where ?
I would like to get my hands on ftp, mail, news and www soft.

This may sound trivial to all You Atari experts but I don't know
the first thing about Atari machines.

Most grateful for any advice !

P.S.
Direct mailing answers would be appreciated !

Nice one Chris....I've had a go myself, but I ended up having to pull some
of the object modules from HiSoft's Libs to get things to work (_CXOVF,__XCEXIT)
- this worked ok for simple programs (fork(); execl(...)) but...

|> Next stop: socket library...

I also rebuilt the socket library, but that doesn't work at all (all
programs crash with bus error, and loads of linker errors from the
bits that actually worked without socket.lib ? I think I'll wait
for Chris to re-do the socket libs for lattice....

>[...] What
>package(s) do I need to actually dial in to my university and get a
>dynamic addressing PPP connection up and running? [...]

You have to get the ppp-212 (or similar) package. This includes source
and binaries for pppd, which actually implements ppp, and chat, which
is an easy way to establish the connection.

I used tip, from the OLD mint 0.95 distrib, to log into the remote
computer and note what strings I had to send in response to strings
from the host. Then I made a chat-script containing these. This
chat-script is then used by chat, executed by pppd, to start the
connection.

Once you have made the ppp-connection, you will of course need: ftp,
telnet, rlogin, fingerd, lynx, Xwindows+chimera, smail, nntpd, trn,
etc. depending on your preferances. You can not actually DO anything
with pppd ;-)

Good luck,

2206. Epson FX Emul Cart for HP DJ500

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-26 00:00:00 UTC
From: mpook@freenet.niagara.com
Message-ID: <D96q18.1Cx@freenet.niagara.com>
Source record: 26025

I have recently purchased a Hewlett-Packard DeskJet 500 printer.
It works fine, but not all my software supports this printer.
I understand that the HP Epson FX-80 Emul Cart (#22707F)
is still available from mail order sources, including HP Direct.

Would someone who already has one, please advise me if the cart
correctly emulates graphics modes of a FX-80. I would like to
use my DJ500 with programs like Printmaster Plus, AwardMaker,
Degas, and others that have graphics output and no driver
available for the DeskJet 500. Hewlett-Packard (Boise) was
kind enough to FAX me copies of the following documents;
"DeskJet Epson FX-80 Emulation ERS" and "Using the HP22707E
or HP22707F Hewlett-Packard EPSON FX-80 Printer Emulation
Cartridge". Both documents do not specifically state that
the cartridge will emulate Graphics Modes control codes,
but neither do they state that it is NOT supported. The local
HP Customer Information Centre and HP DIRECT Customer Support
(Mississauga) have been unable to answer my question.

Please respond via E-mail. Thank you in advance.

Source record: 26027

When I try running AHDI with a Translator on my MSTE I don't get any units responding, though I thought the computer would take one for its own use. Even with my HD connected I get the same results, and a different device doesn't make any difference. I had the same problems with the internal host adaptor. HDX refuses to see any physical devices attached. Does this sound like the DMA chip is faulty, or is there something else ?

ALso, I'm pretty sure that my cartridge port doesn't work. Is this related ?

thanx

the hatter

Rubbish, Connect keeps up quite happily with a 28k8 connection, even
without NVDI.

> FZDSterm has heaps of features and is IMHO simple to use, but forget about
> trying to use it for VT-100/VT-102, it can't cope.

FZDSterm works quite happily with vt-102 - just select ANSI.

>|> as a second disk drive and set it for drive b (1).
>|>
>Sorry, I mean a 360K 3.5 inch disk, as found on a STFM.

Arh, you did not say that !

O.K. you have a 360K single sided STFM and want to transfer files from a PC
via this disk format.

O.K. Comments first ....
1) You can still use ghostlink.

2) Putting a new double sided drive in the STFM is quite cheap and does get
you double the disk capacity on the ST.

If you still want to do this you can format the disk on a PC as a 360K single
sided disk, write your files on it and read it on the ST. It should work fine.

I think that the dos format command structure is :

format a: /t:80 /n:9 /1 format 80 track 9 sectors single sided
or
format a: /F:360 should format a 360 K disk

or
format with a dos formatter (or TOS1.4 or above) a 360K single sided disk on
the ST and then write the data on the PC, read it back on the ST.

I hope this helps

Regards
Mike Wilsher

Well, I am a MultiTOS user, but I don't think I can really recommend it
unless you alreay use MiNT. What might be worth a look is the MiNA system
that is being worked on - a freeware MiNT based MultiGEM with WinX built
in. I am trying to find out details ATM myself.

Another alternative is MagiC, which is very good but not MiNT friendly, so
useless for my needs.
Sorry - I don't know the supplier but I'm sure somene else does:

2217. zip drive info (hope Roger reads this)

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-27 00:00:00 UTC
From: fezzy@perth.DIALix.oz.au
Message-ID: <3q6sju$t8$1@perth.DIALix.oz.au>
Source record: 26036

While looking through a 'for sale' news group saw this add... it may interest some......

From: jfonhof.godzilla.zeta.org.au (John Fonhof)
Newsgroups: aus.ads.forsale.computers
Subject: 100Mb Iomega ZIP external SCSI $399
Date: 25 May 1995 02:59:27 GMT
Organization: godzilla.zeta.org.au

Available at the end of July

The new Iomega external SCSI 4" 29ms ZIP drives (small footprint)
External drive with 240V powerpack, SCSI cable and 100Mb disk $399
additional 100Mb disks $35

This drive is a winner in the USA

Also external parallel version plugs into the printer port with a passthrough same price but slower and for IBM only as no Amiga drivers are available as yet

Review will be in ACAR

Orders taken now. Delivery C.O.D

Details from

John Fonhof for FCS
tel 02-639-7718
Fax 02-639-5995

I think this may clear up the SCSI argument.. But it may take some time for them to get to Roger's part of N.Z. cos he's sure that zip drives are only parallel

Regards

I'd recommend Chameleon, which allows you to load and unload DAs on the fly.
It loads like a normal DA (you can load up to 6) and you can then (automagically
or manually) load well behaved DAs into it (note that they must be well
behaved - the likes of Harlekin 2 don't like it at all, presumably 'cos they
want a early run at the system vectors). Also worth getting is the Chameleon
configuration util.

They're both PD and at the Atari archive (and mirrors) and HENSA.

The SIMM and SIPP Ram upgrade files are on many many sites, I do have a Upgraded version of the SIMM one, a few things I added that are missing in the SIMM upgrade file only after doing some 6 upgrades, one machine that I upgraded was for a Mega ST1...

2.5 Megs is not a problem for ST's or Mega ST's...

If you can't find these files try Hensa or E-mail me....

P.S. there are problems with some MMU chips that are fitted to some machines one of the Mags listed all these MMU chip, from memory there are 4 types of MMU chips...

Only IYO.

Okay - so I'd never go out to buy a Seagate drive (mud sticks) - their drives are a *lot* better than their reputation of old.

^^^^^^^^^^^^

Not all of them - surely?

Iomega 420Mb tape drives are on sale in the UK at just over 100ukp (about $150). These aren't SCSI AFAIK - but are what most dealers are refering to when they quote for Iomega drives.

>bombs! Any ideas.
>

I don't know of any way to get more than 6 accs in a Falcon without
Multitos so sorry to raise your hopes.

However when I needed more than 6 I found the answer in Chamelion which
can be loaded a multiple of times and preset to default load certain accs of
your choice. Clicking on one with Alt & shift pressed clears Chamelion of the
current acc and on the next click will supply a fileselector for *.AC?. This
gave me the ability of loading Xcontrol via Chamelion but replace it with
whatever I want when I need it (eg. a screen saver, or module player).

Use Chamelion - you wont be disapointed, why load accs you may not use
and waste memory. Why be stuck with rebooting because you haven't loaded the acc
you actually want.

The only problem I have found with Chameleon is that it will NOT work
under multitasking systems when memory is at a premium and killing accs can be
difficult.

>
First, get ping to test your connection. If you get no answer from the
server, you need HSModem06 (that was my first problem on the Falcon).

My second problem was with SLIP so I don't know if it applies. Once I could
ping the erver, I couldn't go one level deeper. When I checked the
ifstat for sl0, I was told that all the input packets were too short.
The problem was an incorrect netmask. I needed 255.255.255.0; but
check with your supplier.

: FZDSterm has heaps of features and is IMHO simple to use, but forget about
: trying to use it for VT-100/VT-102, it can't cope.

I dont know what it is with you guys and Freeze Dried, I am at the moment
(as i always am) in VT100 on my net site. I HAVE NO PROBLEMS with my
display whatsoever! That also includes the scroll back buffer. I dont
get ANY ansi codes or other spurious codes at all. There is only one
thing that i have found Freeze Dried does not like and that is when
i do a /list in IRC!

I have Connect, Stalker, Storm, Vanterm, ANSIterm, Teddy Term (and the list
goes on....) and FZDT is IMO the best.

BUT!!!! It took me quite a while to get it working properly on VT100 etc
displays. If you are prepared to work on it a bit, then its Great regardless
of the fact that AARON HOPKINS let everybody down. 8-)

Yep, it was how_fast - I found it from ftp.uni-kl.de.

And about the speed, here's something I wrote to cubase-users mailing list
about the IBM DPES-31080 SCSI-II drive I just bought. Don't believe the
speed testers! :

Howdy all,

I just bought an IBM DPES-31080 SCSI-II drive, and here are some
notes about it. I hope these will be useful to some people seeking
for new 1Gb drives:

It wont work with CAF, unless you have jumpers like this:

Disable Unit Attention : on
Disable TI negotiation : off

When these are set correctly, it works with CAF like a charm. I tested
it with some speed testers, and I was surprised to see it could do only
1420Kb/s, but the seek rate was 12 ms. In CAF manual it says that if you
want to play more that 6 tracks, you have to have a drive that can do
1600 Kb/s. So, I tested it with CAF:

I recorded 8 10-minute segments into 2 216Mb partitions, played them back
and the disk performed flawlessly. There is no apparent calibration during
read/write (also a graphical speed test proved this), so this disk
seems to be an A/V drive.

So, even if it should not work, it works better that any other drive I've seen being used with CAF. It can play 8 tracks of continuous audio with ease (16bit/44.1Khz). So maybe it's time to make some new test-programs for hard-disks, with some steady data-flow tests and other real-life tests.

FYI: I use ICD 6.5.5 software. CAF uses direct internal SCSI-II commands for audio.

I'm looking for an Atari SM124 monochrome monitor -- basically i've 2 520STs here that I would love to give to a friend (he wants a basic starter MIDI system) but I don't have another SM124. I would pay $50 for one if anyone has one to sell.

I've also 2 ST354 SSDD drives, but with no power supplies for them. With this in mind, perhaps it would be better if someone could sell me a 520STFM? I would pay $50 for this as well ...

I live in the USA, and prefer COD ... hopefully this won't be a problem! The stuff would be used by a person who _really_ wants to get into MIDI.

>Does this sound like the DMA chip is faulty, or is there something else ?
>
>ALso, I'm pretty sure that my cartridge port doesn't work. Is this related ?

It could be that the cartridge port fuse has blown, that is, if you have
been experimenting with it :-) The fuse is a small transparent resistor
like thingy located in the neighbourhood of the cartridge port. You can
check if the cartridge port still has 5 volts on the power connections. If
not he fuse has blown and should be replaced, not an easy job as the thing
is soldered in place and I haven't got a clue were you can buy these
fuses... (with some fiddling you can replace it by a small 0.5 Amp fuse)
The cartridge port doesn't have any additional parts, it's connected
directly to the processor bus.
If the fuse has anything to do with your DMA problem is hard to say, but
give it a try.

There is a board called 'MultiBoard' for the ST/STE series which can hold 2
TOS roms (for TOS 2.06) and has an IDE connector and a PC slot for
connecting a TSENG ET4000 VGA card. I haven't got an address were you can
order it though, but I will try to find out.

I use Connect 2.46 which handles very well those emulations !
It is Shareware. Depending of type of your modem it can be
used as an answering machine too (Zyxel).
Fax is not available (yet).
Shareware version have time limit (30h usage).

I think it's called >conn246e.zip> in verious atari ftp-sites.

Obviously not.

If the jumper settings are the same as when you started it - then you have probably blown it. I had a Micropolis drive that just stopped working like this (well after a bit of handling ;-)

Otherwise phone up Connor and get the spec sheet. They should send it to you for free.

> would be helpful.

There have been some encouraging reports here of it working. I believe it needs TERMPWR supplied - which the ICD interfaces don't supply.

However ICD have apparently had one up and working with a Link (2?) so this is obviously fixable. I have a ST1280N with TERMPWR enabled in the cahin so I *hope* I'm going to be okay. I intend to order a ZIP this week if nobody gives me a good reason *not* to buy one.

As the DOS/Mavc versions - I think its more of a case of SCSI and Printer port versions.

Its true to say that MAC users will use the SCSI version and the majority of PC owners will use the Printer port version. However the SCSI version should work on the PC (with SCSI card) and is also the one you want to buy for the Atari. The Printer port version is *not* going to work on the Atari. The Atari's printer port is just not up to the job AFAIK.

All IMHO and AFAIK as I haven't tried any sort of ZIP on anything yet.

:-)

Roland.

Well no one has ever got it to work on this DEC site, it does not Support VT100 at all, in fact I would rate it as 200% RUBISH, no ARGV support, can't use GRZRZ with it and its programed in GFA Basic..

FZDT is mostly used here by Teenagers, has all the glits that they like..

But as they say all that glitters is not Gold....

: I need to know if the Atari SMM 804 printer uses standard ascii code and
: the same cable as an IBM-compatable printer.

It sounds as if you want to connect the Atari SLM804 to a different brand
of computer. Unfortunately, that is NOT possible.

The SLM can only be used with an Atari computer which has a DMA port.

The reason for this is that in an attempt to keep costs down, the SLM was
designed with NO internal control electronics. The Atari ST computer and
its memory were used for this. It worked pretty well, but unfortunately
means that the printer is useless for any other kind of computer.

BobR

Re: Transferring disks from an IBM to an ST with a single sided drive.

I know this is possible, but for the life of me I can't remember the magic words to make it work..

You have to tell DOS to format a single sided 360K floppy.. and that's the detail I can't remember... nor do any of my current DOS manuals have anything about it.

It's been a long time since I last read about how to do this, and it's possible the formatting option has been dropped from more recent versions of DOS.

You might be able to get away with formatting the single sided floppies on the ST, using a formatter which will write DOS compatible boot records, but that's something I've never tried.

Sorry.. I wish I could remember how to make this work.

Well there's something around here that 200% rubbish so you got that bit
right.

I don't see GFA Basic has any bearing on the matter, you can program
properly and poorly in any language.

> FZDT is mostly used here by Teenagers, has all the glits that they like..

Really. Did a survey did you, out on the street asking lots of teenagers if
they use FzDT?

If someone started doing that around here I'd begin to get a litte worried.

> the latest version ?

The FaST Club have just started advertising Gemulator 4 in ST Applications.
Info taken from the advert:-

- Improved drive access, can now access all hard drives, removable drives
and CD ROMs connected to your PC.

- Windows and DOS applications can be launched directly from the GEM desktop
This allows the Atari NewDesk desktop to be used instead of Windows
File Manager and Program Manager.

- The interface has been simplified - all settings are now made using
Windows popup menus - does away with the old Gemul8r.ini file.

- Better hi-resolution support. As Gemulator 4 is a true Windoows
application it can make use of any Windows screen drivers installed.

- Using Windows drivers has improved the Gemulator support for modems,
printers, sound and MIDI.

- Requires an 8meg 486 or Pentium PC running Windows 95 or Windows 3.1 (or
3.11) with Win32s version 1.2 installed.

- As Gemulator 4 is an STE emulator it needs STE ROMs (TOS 1.06) or Mega STE
ROMs (TOS 2.06)

- Availability: June 1995

- Price estimated at 125UKP (TOS ROMs extra)

Hi,
I have a friend in England who has a 1mb STE. She wants to get on email,
but doesn't know where to start, and as I know nothing about the STE, and
very little about what's what in England I can't help her. So if anyone
from the UK could help me with the following questions I would be very
grateful...

Will any modem work with the STE?
What software is best (preferably shareware)?
Where/How does one get an internet/email account in the UK?
How much does it all cost (equipment, software and email account)?

email replies preferred but not essential,

TIA

You need dip, which is somewhere under the Mint/Network directory
on the Atari sites. Unfortunately, this needs to have a valid login
environment, so you need to either run MiNTOS or just 'fake' it
by running just the login from here. (MiNTOS is kinda cool, it gives
you a 'unix like environment', but thats what Linux is for :-)

Should work since the Falcon, (or the ST) doesn't support paritet. But you
need a special Ram card to use the 72pin simms.

MFM or RLL, it doesn't matter as they're compatible. (Only problem is you
lose about half the size when using MFM, (or is it RLL, can't remember now)).

MegaFile 44 is a newer device, and scsi as you say. What i meant was the
old Megafile 30/60Mb drives. Megafile 44 got an host adaptor inside i the case
i think.

How_Fast doesn't give any graphiccal result, does it ? I havn't discovered
that.. (well, it shows some linies ofcouse, but thats not what i think when
speaking graphical). But an old program i have here on my board does, and
it's useless as it gives wrong results, and bombs on machines with Tos 1.6
and above. This program gives a real sprech sheet like result, with circles
and stuff like that.

Hi

I'am using a FREEWARE Mouse Driver for all serial ports on any Atari.
It's called MOUSE v.2.3.

Works on Modem1, Modem2, Serial1 or Serial2 under any TOS/MTOS/MagiC 2/3.

Works great with Microsoft Mice, Mouse Systems Mice and Logitech.
3rd Mousebutton has double click feature.

BTW:
The german Computer Magazine ST-COMPUTER had a hardware project that
makes it possible to use Microsoft-Mice work on the standard Mouse port
of the Atari ST(E), MegaST(E), TT and Falcon.

Its a lot of hardware (Processor, Eprom) and stuff, cost: about 60$

Sorry for my bad english, School is a long time ago ;-)

Greetings from (the rainy) Germany

At least James Woods doesn't hang out here... But I think you mean the
serial port. If you want to hook up a serial mouse to the mouse port you
would need to do some major surgery.

>DMC Publishing, out of Toronto, sells such a driver, and it's my understanding
>that a similar driver is available for ftp from atari archive sites.

I think they are made by the Cyrel graphics people. DMC does the
distribution.

Dom

2260. How do I connect ST to NEC Multisync monitor???

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-29 00:00:00 UTC
From: markw@southwind.net
Message-ID: <3qbd3p$n71@onyx.southwind.net>
Source record: 26076

I was wanting to use my NEC Multisync II monitor on my newly acquired
1040stf. Is there an adaptar available to go from the round
connection on the Atari to the 9-pin connector on the NEC ?

help me please!

markw@southwind.net

2261. PAK68 vs. T28/36

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-29 00:00:00 UTC
From: mms02bj@loqi.elka.pg.gda.pl
Message-ID: <3qcadq$l4i@sunrise.pg.gda.pl>
Source record: 26077

```
Some information about the PAK3 and T28/T36
===========================================

0. Credits
It's a compilation of articles from comp.sys.atari.st and mail, I've
recieved. Thanks to all helpfull persons. It is written in first person,
but mostly I'm not the author. And I still have to learn English, I'm
afraid...

1. General
The PAK3 is, as the name says, the third generation of an accelerator
board for MC68000 based computers (PAK ~ Prozzessor Austausch Karte =
english: processor exchange card -> pec ;-)). Its design has fully been
published by the German computer magazine c't, including the schematics
and GAL equations (issues 11/93, 12/93 and 2/94).
The board has been designed to emulate the MC68000 processors bus
interface at best, so it is not Atari specific but can used in Amigas
and Macs as well. To run a PAK3 on an Atari, you will need at least TOS
2.06, but the better choice is a (patched) TOS 3.06. The PAK3 has a 32kB
cache.
HBS 640 T28 and T36 are accelerator cards that speed up a 68000 to 28 or
36 MHz. An interesting thing with this card is the Fast-ROM (switchable)
16MHz access to the ROMs/EPROMs. 64kB cache is implemented. TOS 2.06
recommended.

2. Now to the technical stuff...
There are two versions of the PAK3: One for an MC68020 processor, its
full name is PAK-68/3-020, and one for an MC68030 processor called
PAK-68/3-030.
Technically, both versions are the same, but have different PCB-layouts
with regard to the different pin layouts of both processors. There are
some advantages of the -030 version, though. You can use the PMMU
capabilities of this processor for memory protection and virtual memory
purposes. There is also a fast-ram (alternate ram) option planned for
this version. But if you 're only interested in speed you'd better take
the -020 board, because the MC68020 is much cheaper than a -030. The
-030 board has only a slight advantage in speed of about 15% max.

3. More technical stuff...
The whole bus interface and all other logic (except two '541 drivers)
consist of five GALs, so every change in design can be made with new
GAL equations.
The 32 Kbyte second-level-cache (1st is in CPU) is made of four
CY7C185-25 cache-rams and two MK48S74-25 tag-rams (it's hard to get
them!). This cache is optionally, the same with a 68881/2-FPU.
```

There are also four sockets on board for OS-EPROMs, so that the CPU
has full 32bit access to the operating system.
Additionally there are some capacitors, resistors an oszillator and
a 74F86 for 8 to 16 MHz clock doubling.
You can use the PAK3 in two modes, the synchronous mode (16 MHz),
driven by the clock doubled 8 MHz from the mainboard, or the
asynchronous mode (32 MHz) driven by an oscillator on the PAK.
In my opinion there's no reason to use the PAK in the first mode,
except you have an overcritical designed mainboard (like the Amiga).
Note, that there are different GAL-sets for each configuration
(type of computer, CPU, mode)!
In most cases an Atari will also run with 36 MHz CPU-clock (asynchr.) on
the PAK, sometimes it will even run at 40 MHz, just change the oscillator
to try this out.
A few net fellows tuned their cards up to over 50 MHz.
'Unfortunately', my PAK3 runs 'only' at 36 MHz in my Mega ST. 40 MHz runs
well after a warm-up time of about 15 minutes but it bombs in cold state.
It seems not to be a big problem so maybe I can fix this sometime.
There are a lot of 40 MHz PAKs around, running without problems.

4. Mechanics
To install the PAK you have to remove the old MC68000-CPU and solder
a 64pin socket in, where you can plug in the PAK. There's
also an option to install the old CPU onto the PAK with an additional
GAL. The PAK has the dimensions 152x89 mm and fits best in Mega STs.
It's difficult with the smaller ST's in the keyboard-cases because the
PAK is too high, the OS-EPROMs are piled upon the cache-rams.
You better build them into a PC-Tower. Adapters for ST's with PLCC-CPUs
are available.
The Blitter has to be removed or switched off, the new
processor is faster anyhow.
It's (always) recommended to replace the 74LS244 and 74LS373 drivers/
latches on the Atari-mainboard by faster 'F' types.

5. Software
You can run the PAK with Atari's universal TOS 2.06, which needs not to
be modified. Older TOSses cannot handle with CPUs > 68000.
But if you want to use the PMMU capabilities of the PAK3-030 you 'll
need a (patched) TOS 3.06 which supports the PMMU. There are also
difficulties with some harddisk-drivers on a PAK3-030 with TOS 2.06
because of uninitialized PMMU-tables, but AHDI works fine.
The TOS 3.06 patches are published in c't 2/94 and are available in
source code so it should be easy to adapt them to other than the german
TOS 3.06.
All well programmed newer Software will run on the PAK without
problems. Some games and software with loops for time-delays or
dirty tricks like self modifying code will have problems.

6. Costs
The PAK is thought as a do-it-yourself project. The PCB costs
about 100 DM, each GAL costs 10 DM if you don't burn it yourself.

Further costs will depend on your configuration (CPU-Type, with or without Cache or FPU). There are some companies here in Germany which sell also ready-to-use PAKs and parts-sets mostly with cheap used processors. Parts-sets are about 550 DM and assembled PAKs about 700 DM (both w/Cache and used CPU, w/o FPU and TOS). Maybe you have cheaper sources of the chips, especially the CPUs, in overseas.
One have paid ~DM500, including the 68030, multi-layer PCB, Cache RAMs, 4 system EPROMs and all other parts. One other have paid 400UKpounds for it from System Solutions. This included TOS3.06, 68882 FPU and 68030 CPU all running at 32 MHz.

7. Advice
This is absolutely NO project fo beginners! It's a 4-layer PCB with approx. 800 pinholes.
You should only do it on your own if you would fly in a plane you 've soldered yourself.
The MegaSTE seems to have some problems with the HBS 640 T28 and HBS 640 T36, especially with the 36MHz card. Any ST seems to have some problems to handle signals of > 32MHz (approx.). The safest, fastest, and most expensive (depen- ding on how much you have to pay for the CPU/FPU) card seems to be the PAK3 (full name PAK 68/3-030) sold by the following companies:

Average: 119% 129% 138%

my own benchmark : 494% 524% 570% (rel. 8 MHz ST!)
LKURZ (all three runs): 7'59" 7'40" 7'25"

My own benchmark is more calculation-based (sieve, sort, matrix
inversion...) in contrast to the GEM-graphics tests of GEMBench, but
without FPU-code. You will gain some more performance of OS-routines
if you use TOS 3.06, because of some -020-code in it. LKURZ is a
typically speed test (german) for TeX, sorry for having no 8 MHz values
but it's about 5 to 6 times slower.

Other GEM Bench results:
T28 T36 PAK3 ST+NVDI
32MHz 8MHz

All nubers are in % rel. an 8MHz ST

9. Epilog
I've done this summary because I think the PAK is the best thing you can do for your Atari. Compared to the old 8 MHz machines, a PAK-ST is really unbelievable fast. Even if you have to do fast calculations there's no more need to buy a clumsy clone and dump your easy-to-use Atari together with lots of well designed software. The PAK also runs very stable and uncritical in comparison to other accelerator boards. Most (all?) developers are on the net.
You get what you pay for! The T28 works fine on an STfm (according to "ST Computer") and costs approx. half as much as the MUCH quicker PAK3.

10. FAQs:
Q: Can a PAK/3 be fitted into a standard STE?
A: Yes!, MW Electronic is selling a DIL->PLCC adapter so it can fit the STE.. But you can't have your originalcase i think.

Q: Is PAK/3 a commercial board or is this a kit that I can build myself?
A: It's some sort of 'commercial' kit.How to build a PAK/3 was described in german computer-mag "c't".But if you are to lazy to make the whole card you can buy it - both as do-it-yourself-kit or as fully operating card.I don't know where to look for such cards in US,but in germany (and in europe too,i think) many dealers carry this card.

Q: Does it comes on a PC board? Does it have a '881 socket?
A: There is a 881 socket. The PAK comes on a PCB that is plugged into the socket where the 68000 was before. The PAK is not too small, in all computers except Mega STs you will probably need a new case. Documentation on the PAK was in the german computer magazine c't (Heise Verlag, Hannover), in three issues around 1/94.

Q: Is Calamus working with it? And if yes, is it really faster?
A: I use Calamus 1.09n with my PAK board and it works fine - a lot faster than the 8MHz 68000 I used to have in my ST.

Q: Is there something similar/better to it?
A: The is a (French?) board called the SST which also uses the 68030.
Other than that I do not know much about it. If you get a 68030
accelerator such as the PAK and SST Linux (Unix clone) will run on it.

If anybody can add something here, just do it! Many people will
apreciate it!

You have to remove the cover. On the main board You'll find the set of
adjusters. Just try them with a small screwdriver.

Good luck!

2265. 3d Shooter Ideas...

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-29 00:00:00 UTC
From: dking@gbc.gbrownc.on.ca
Message-ID: <3qcupe$bbn@gbc.gbrownc.on.ca>
Source record: 26081

I am currenty working on a 3d-shooter in the star-wars (arcade) vein. I think I will make it only STe so I can use the extra features of the machine (probable 1 MB also.). I will try t-mapping and shading but will cut out what I have to to keep the speed nice and frantic. I would like to make many levels but the only ones I am thinking of right now are a trench (like star wars) and the towers (like the top of the death star). I would like some other ideas for other levels. Just email me if this interests you.

I would like also to talk about game programming for the STe. I get a lot of info about algorithms from the PC groups but I would like to know who ia doing games for the atari and what neat tricks they have dreamed up.

I am using assembler to write in (Devpac 3), so let the code snippets fly!!!

Ralf: If ouyr picture has been steadily shrinking, it sounds like
you've got some electrolytic capacitors in there drying out. There
are horizontal and vertical size controls in there (a coil and a pot
if I recall...), but you've really got to cure the original shrinking
picture problem first

I've tried formatting in DOS to get a 360K on a 3.5 inch disk, but it says
that the parameters aren't supported by the drive, and fails. And
formatting on the ST and then putting in the PC is no good, 'cos it says that
it can't read it.
Thanks for the help, though.

Yes, the STE has a standard serial port (up to 19k2 without further
modifications).

>What software is best (preferably shareware)?

HSMODA06.LZH (serial driver, Shareware?) and UPoint light (Freeware).
I don't know whether there are English versions and docs floating around,
though. Both are originally German programs.

UPoint allows Mail/News access via UUCP only, but that should serve your
purpose, as anywhere where one may get SLIP, one will also get UUCP
access.

: > come as SCSI devices, Roger)
: ^^^^^^^^^^^^
:
: Not all of them - surely?

: Iomega 420Mb tape drives are on sale in the UK at just over 100ukp (about
: $150). These aren't SCSI AFAIK - but are what most dealers are refering
: to when they quote for Iomega drives.

Gotta watch those low capacity tape drives. A lot of them are
"floppy tapes" that plug in between the floppy and the controller, and
require special software. Either that or they are propriatory tape
controllers. Which is one reason why they are so cheap. SCSI tapes
are generally higher in capacity, and are more expensive. It's also
difficult to find QIC SCSI tape drives these days, quite a number
of them are DAT (or even 8mm). That's not to say they don't exist,
but finding one isn't easy.

Hi, Does anyone know if Gasteiner in Germany have an e-mail address ?

I am trying to get one of their Toplink host adaptors to work with an
IBM SCSI drive but I'm having little success.

I have tried gasteiner in the UK, but the reason I got from them as to why
it wouldn't work with my IBM drive was "Erm...I don't know". They
suggested that the power supply was not big enough, so I asked them
how much current did the Toplink take. The answer: " Ohh, about five
VOLTS " !!!!

You see what I'm up against ?

That is why I want to talk to someone in Germany :-)

Thanks in advance,

Kev.

Pekka Saarinen (contacts@mits.mdata.fi) wrote:
: Could you post these instructions here, please? There are many of us
: here who have no access to Compuserve.

Here is the file from Compuserve that Bob Retelle sent me via email. But I don't know if it would work on anything but a Microsoft version 1 mouse. Looking at the diagram, it doesn't look like the Microsoft v1 mouse connector was a DB9 pin or a 6 pin PS/2 connector. It looks like some custom thing. All the mice I see sold today have either the DB9 pin connector or the 6 pin PS/2 connector. Neither one of which I have the pinouts for. But here is the file, I don't know who wrote it. Let me know if you can decipher it:

==========

Subject: How to hook-up a MicroSoft mouse to an Atari ST

Here's a repost of my article of wayyyy back (Feb 1989) on how to hook an Microsoft mouse to an Atari ST. No software changes are required. All it takes is creating a special cable between the mouse and the Atari.

I've been using a Microsoft mouse now for around 2 years on my 1040, with nary a glitch. It's so much better than the Atari mouse, I'd never go back. (IMHO)

Well, here is how to connect a Microsoft Mouse to an Atari ST. (520/1040) The Atari has a 9-pin D-type connector. The Microsoft Mouse has a rather strange connector on the end. To prevent having to cut the mouse cable up, I made this adaptor. If you still can't follow it, please let me know and I'll try to redescribe it. This does work for me. I've been using it for 6 or so months now [Note, it's been 2 years now!] with no problems at all. It does take some soldering skills, so if you're not so hot at soldering, find a friend to help.

As far as I know, this does not effect your Atari's warranty. However, I have not asked Atari.

Atari ST	Microsoft Mouse ST	expected signal
1	5	XB
2	3	XA
3	8	YA
4	9	YB
5	N/C	N/C
6	2	Left button
7	N/C	+5VDC (N/C)
8*	6	and also tie to pin 1 Ground

9 7 Right button

* = I am not sure why I have pins 6 & 1 tied together, but it does work.

The Microsoft mouse connector looks like this. This is the solder side,
with the leads pointing up.

```
---------------
| 1 |
| 2 3 4 5 |
| 6 7 8 9 10 |
| |
---------------
```

If you can not use the connector, the pins are numbered as follows. This
is the connector side from the Microsoft Mouse plug:

```
/------------\ This is a view at the front of the connector.
/ Blank "KEY" \ It is where the plug from the mouse would be.
/----------------\ The pin labeled 'n' is not connected.
| n 4 X 8 | The place labeled 'X' is filled, and does not
| 9 7 1 2 | have a pin.
| 5 6 |
\ /
\------------/
```

Have fun!

For those who don't want to face wiring up a Microsoft mouse to their
Atari, there is another solution. I just bought a Golden Image Mouse
and I'm very pleased with it. They have an Atari ST version, so you
just plug it in. The feel is similar to a Microsoft mouse, but the
mouse is slightly larger.

It's made my working time with the computer much less stressful. I
highly recommend it to anyone who works with their Atari a lot.

I'm not affiliated with this company in any way, I just like this
mouse.

It cost me $70 Canadian, and was worth every penny. As a comparison,
the standard Atari mouse costs $45 here.

your note prompted me to re-attempt getting my 3 button logitech to work.
it's very slightly different from the microsoft. The two up/down wires
must be swapped--they are backwards from the microsoft configuration.
I connected the right and middle buttons--the middle and left buttons
work as right and left. Logitech's "technical information" is too
sketchy for me to do more than guess what's going on (a page and a half
on hardware and many more pages about software stuff that's of no use
to an st user.)

2273. Zip Drive to Atari STE

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-29 00:00:00 UTC
From: henryc936@aol.com
Message-ID: <3qcu1b$d68@newsbf02.news.aol.com>
Source record: 26089

I have my new Zip up and running on my Mac Performa and boy dose it Zip.
:>)

I would highly recommend it for the Mac or Dos machine. As for as using it on an Atari, I am still looking into that possibility. It was mention that ICD had one up and working with a Link II and I was wandering if anyone on the net might have an e-mail or WWW address for them. I need to ask them some questions before I spend to much $$$ trying to get the Atari STE and the Zip drive talking.

I just got the Demo for MagiC Mac, the Atari emulator to run on my Mac Performa 405 and it will not install. I keep getting a dialog box and it is in German so I don't know what it says. The read me files are in German also so I am at a loss to get it up and running.

Dose anyone on the net have these files in English so I can see if the $200 price tag is worth it. It sure would be nice to run my Atari software on my Mac.

Regards,
HEC

2276. Connecting a CDRom drive to an ST

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-30 00:00:00 UTC
From: odonnllb@vax1.tcd.ie
Message-ID: <1995May30.124508@vax1.tcd.ie>
Source record: 25945

This is for a friend who doesn't have net access, so I may have
garbled it slightly.
He has the Link and a SCSI hard disk and has been looking at the
cost of SCSI CDRoms. It seems that you pay a lot for the privilege
of having the power supply in the same box.
So he wants to know if anyone has tried just sticking together a
power supply and an internal CD drive in a shoe box or similar
high tech enclosure.
TIA
Brian O'Donnell

Source record: 25946

In article <3qbd3p$n71@onyx.southwind.net>
markw@southwind.net "mark weddle" writes:

> I was wanting to use my NEC Multisync II monitor on my newly acquired
> 1040stf. Is there an adaptar available to go from the round
> connection on the Atari to the 9-pin connector on the NEC ?

I think you need this:

NEC MultiSync II to Atari ST
--- --------- -- -- ----- --

Copyright (c) 1988 David S. Weaver
All rights reserved

This file may be copied freely only with the inclusion of the above
copyright notice for non-commercial use.

The NEC MultiSync II is an easy monitor to connect to your ST if
you want a monitor that can be used with systems other than just the
Atari ST. The following text describes how to build a switch box
to connect the MultiSync II to the ST to allow use of color or monochrome
with the flick of a switch.

Some specs for the MultiSync II and Atari:

NEC MultiSync II Atari
low medium high
------- ------- -------
Horizontal Frequency: 15.5kHz - 35kHz 15.8kHz 31.5kHz 35.7kHz
Vertical Frequency: 50Hz - 80Hz 60Hz 60Hz 71.2kHz
Horizontal Resolution: 800 dots 320 640 640
Vertical Resolution: 560 lines 200 200 400
Signal level: TTL pos --- --- ---
(analog) 0.7Vpp 75 ohm pos 1.0Vpp 75 ohm
Sync Signal level: TTL pos/neg TTL 3.3K neg
(analog) 0.3Vpp neg --- --- ---

As one can see from the chart, all the Atari specs fall with the NEC's
except for the 35.7kHz (instead of 35kHz) which doesn't seem to be a
problem. Also the video signals are a bit high (1.0Vpp rather than
0.7Vpp), but it seems to be working just fine without the addition of
any resisters. (If you want to add a resister, you would need 107-75
ohms or 32 ohms in series for the RGB signals, if I did my math correctly)

I initially had a problem with the NEC not syncing to high rez mode on
the ST after powering off the monitor and then powering it back on

again. The workaround was to either unplug the video cable, or reboot the ST. I decided to add a switch to break the horizontal and vertical sync lines. During the process, I switched the cables I was using to feed the DB9 connector to some that were more flexible because I had a problem with the signal lines breaking at the connector. I also grounded the DB9 connector to the shield ground in the cable from the Mega ST. As a result of this rework, I found I no longer needed the extra switch to interrupt the sync signals.

The following pin assignments are what work when connecting an NEC MultiSync II to a Mega ST2 for color operation, they should work for any of the ST series:

MultiSync II Mega ST
(female DB-9) (male 13 pin DIN)

pin 1 red pin 7 red
pin 2 green pin 6 green
pin 3 blue pin 10 blue
pin 5 mode control or v sync pin 12 verticle sync
pin 4 h/v sync or h sync pin 2 composite sync
pin 6 red ground pin 13 ground
pin 7 green ground pin 13 ground
pin 8 blue ground pin 13 ground
pin 9 ground pin 13 ground

The Mega ST can also use this combination for sync:
pin 4 h/v sync or h sync pin 9 horizontal sync
pin 5 mode control or v sync * not connected

For monochrome to work, use the following connections instead of those listed for the same pins above:
pin 1 red pin 11 monochrome
pin 2 green pin 11 monochrome
pin 3 blue pin 11 monochrome

* Connect to pin 13 (ground) if you want to increase the vertical size on the screen. Not really needed as the front panel "v size" switch has enough control, and the image size is big enough with the "v size" switch in the dentented position.

In addition, you will want to provide a separate RCA jack to provide an audio out connection, given that the Multisync has no audio capabilities:

RCA jack ST connection
-------- -------------
audio pin 1 audio out
ground pin 13 ground

I ended up buying a "multisync" cable from Practical Solutions.

The Practical Solutions cable has the following color coding:

```
Pin Color Function
---- ------------- ----------------------
1 yellow coax audio out
2 black coax composite out (composite sync on Mega)
3 n/c
4 red monochome monitor (ground for monochrome)
5 n/c
6 green coax rgb - green
7 red coax rgb - red
8 blue coax shield +12V (may vary from ST to ST)
9 black horizontal sync
10 blue coax rgb-blue
11 white coax monochrome
12 white vertical sync
```

The following was verified with an ohm meter:

```
13 yellow coax shield ground
black coax shield ground
green coax shield ground
red coax shield ground
white coax shield ground
```

In addition the shield appeared to be grounded as well.

I cut about a 6" length of cable off the cable from Practical Solutions
and used it to wire in a few switches to switch both the monochrome/color
signals and the h/v/composite signals. This cable is much more flexible
than the cable I tried using in my first attempt. By separating the
individual shielded cables from the bulk wrap, you can get some very
flexible/thin shielded coax.

The switch box ended up something like the following:

```
Atari ST pin 4 pole NEC Multisync-II pin
(13 pin DIN male) double throw (DB-9 female)
----------------- toggle switch --------------------
+---------+
| |
Blue Cx 10 - rgb/blue ------- |
| /--------------- rgb/blue - 3
White Cx 11 - monochrome -----/ |
| |
Green Cx 6 - rgb/green ------ |
| /---------------rgb/green - 2
White Cx 11 - monochrome -----/ |
| |
Red Cx 7 - rgb/red -------- |
| /---------------- rgb/red - 1
White Cx 11 - monochrome -----/ |
| |
```

```
- n/c ------------ |
| /---------------- ground - 9
Red 4 - mono monitor----/ |
| |
+---------+
2 pole *
double throw
toggle switch
+---------+
| |
Black Cx 2 - comp sync ------ |
| /-------- comp/horiz sync - 4
Black 9 - horiz sync -----/ |
| |
| |
White Sh 13 - ground --------- |
| /--------- mode/vert sync - 5
White 12 - vert sync ------/ |
| |
+---------+
```

* This switch is purely optional, it allows use of both types of video sync, and will ground the mode pin to increase the vertical size when composite sync is switched in.

```
Red Sh 13 - ground ------------------------ red ground - 6
Green Sh 13 - ground ---------------------- green ground - 7
13 - ground ------------------------ blue ground - 8
13 - ground --------------------------- ground - 9

Yellow C 1 - audio out --------------------- RCA signal line
Yellow S 13 - ground ------------------------ RCA ground line

shield ------------------------------------- shield
```

Note: Do NOT connect pin 8 (Blue coaxial shield) to any other pins/signals. This pin may have +12 volts on it. Make sure that you insulate the shield very well on this line so it won't make accidental contact with another signal.

When the cable is all built, use an ohm meter and make sure that you have no shorts. When you actually want to hook it up to test it, set the switches on the back of the MultiSync II to the following:

Switch State

manual switch on
mode switch gray (shouldn't matter, digital only)
color mode switch 64 (shouldn't matter, digital only)

Set the switches on the front to the following:

Switch State

v posi adjust after powering on
v size adjust after powering on
h posi adjust after powering on
h size on
text off (shouldn't matter, digital only)
text color white (shouldn't matter, digital only)

Now turn on power and you are on your way. Note that for all of the cabling of video signals, I used shielded cables (highly recommended) and soldered all the coax shields together and to the ground pins (use a smaller braided cable to actually connect between the shields and ground pins).

#	Part#	Description	Price:	Source:
1	76108	16-130 1 7/16"x4 13/32"x3 7/32" black box	8.99	A/E

(602)884-9612 1-800-343-0874
(617) 366-8899

You will also need various drill bits, solder, and some tool to cut a hole for the DB9 connector into the plastic end of the aluminum/plastic box. The grommet is to protect the ST monitor cable entering the box.

Disclaimers:
o This hookup worked for my Mega ST, I make no guarantees it will work correctly on your ST, it has also been tested on a 1040 ST using the h & v sync and seemed to work just fine.
o I have no connection with NEC, Practical Solutions, Active Electronics or Radio Shack.

2280. GEM based FTP Client - Progress

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-30 00:00:00 UTC
From: "Craig. Graham" <Craig.Graham@ncl.ac.uk>
Message-ID: <3qf17v$et@whitbeck.ncl.ac.uk>
Source record: 25949

I'm writing a proper GEM based FTP client at them moment, so here's a
short progress report:

o MiNT-net libraries are ported to Lattice C and working ok.
o The GUI is built (uses same GUI libs as CLAv3, for those who've been doing
testing for me).
o Server selection from bookmarks list works.
o Get's correct IP address from remote or local nameserver.
o Opens connection to FTP server ok.
o Get's remote OS type.
o Logs in.

That's it for now......quite an achievment, I only started writing it
last week and it's connecting already :)

Runs under MiNT+MiNT-net, either using plain ordinary GEM or MultiTOS.
Windowed dialogs, popups, colour icons, 3D, yep - the full ensemble. Expect
an initial release before the end of June.

Craig.

2281. MINTLIBpl46 for Lattice....

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-30 00:00:00 UTC
From: "Craig. Graham" <Craig.Graham@ncl.ac.uk>
Message-ID: <3qf0p8$et@whitbeck.ncl.ac.uk>
Source record: 25950

I seem to have mislayed Chris Ridd's email address, so this is going to everyone.

I've been using the Lattice port of the MiNTLIBpl46 to build a GEM based
FTP client (using Steve Sowerby's port of the MiNT-net library to Lattice),
and have come across a problem in that atoi() and atol() both appear to be
broken - as these both use strtol() I assume it's strtol() that is broken -
but I forgot to get the Lattice sources when I got the binary release, so I
cann't check it ATM. As a temporary fix I've patched the MiNT-net functions
that use atoi() to do the conversion themselves.......but that's only a
temporary measure.

(I'm using Lattice 5.52).

Craig.

Is there a way to get NEWDESK.INF to work with MultiTOS when it's length is over 4196 bytes? A program or stuff? I know there is some programs that do the trick like SHBUF.PRG, but it dosn't work with MultiTOS (doesn't like the AES version). Help please, 4192 bytes isn't enough. My Inf file is at the moment ~6000 bytes.

I have coded a very dirty trick to get that big inf-file to work with MultiTOS, but it doesn't work very well.

I can't be the only one that has problems with this.

Great stuff.

> Runs under MiNT+MiNT-net, either using plain ordinary GEM or MultiTOS.

FWIW I think MiNT-Net is the way to go for this kind of stuff, ok so it's a
not a setup for the "non-techie" but a common base and "platform" for all
apps to run under seems the best way to go to me.

Howdy,
I know nothing about music and nothing about this NewsGroup. Please excuse me if I am asking the wrong group.

I have a friend who will be visiting from England. He has an Atari 1040 running "C-LAB Creator" music sequencer software.

Problem: How can we run those C-Lab song files on PC Music software in USA. He tried converting to Midi files but it is taking forever! Does anyone have any solutions?

Any guidance will be deeply appreciated. Please reply to my address:

MARSON@PEMVAX1.PEMBROKE.EDU

I thank you in advance.

Steve

2288. One last plea for Falcon HW help!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-30 00:00:00 UTC
From: Jay T Millar <jmillar@delphi.com>
Message-ID: <xK5-cPc.jmillar@delphi.com>
Source record: 25957

Hi all,

I've been randomly complaing about a couple things for a while, and haven't found solutions. In any case, I'm sick of bitchin', so I've decided o to make one final plea before I send my Falcon in for servicing of some kind!!!!

Questions and problems:

1) My external SCSI drives always time out. It's really annoying as it crashes the machine. Anything I can do about it?

2) My internal IDE _POWERS DOWN_ on a random basis (not often). I know someone posted a solution to this problem a while back, but I hadn't experienced it at the time. Anything I can do about it?

3) Certain program, when they produce sound/music from my Falcon, cause my machine to crash. This consists of the machine freezing on a certain note/sound. This too, really sucks. Anything I can do about it?

Machine configuration:

(all of the above problems occuring under this configuration)

Falcon030 4/80
TOS 4.04
English/American TOS
AHDI 6.061
Completely clean system (only XCONTROL and CPXs installed)

God bless you for any help!

Errr, that's just a comms program, ok for a shell account.

If you want something proper then you'll want a PPP/SLIP login through
someone like Demon.

For this you can use ka9q and OASIS with it.

From: sbriggs@powerup.com.au
Message-ID: <3qghh3$u1i@enterprise.powerup.com.au>
Source record: 25965

hello,
i have an atari 1040 st and a commodore 1081 monitor.
i would like to connect the st to the monitor by a lead from the st's
monitor port to the 1081's scart port.

unfortunatly, a lead does not exist so i will need to make my own up, but
i am unsure of what pins are what on the scart port of the 1081.

if any one can help me out could they send me some type of diagram.
thanks
shannon (Sbriggs@enterprise.powerup.com.au)

2297. FTPD - how to get it to work?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-31 00:00:00 UTC
From: "Craig. Graham" <Craig.Graham@ncl.ac.uk>
Message-ID: <3qhoc0$m0r@whitbeck.ncl.ac.uk>
Source record: 25966

I'm having a few problems with the FTP server for MiNT-net.

How do you get it to work? I've done all the things I'm supposed to,
and the FTP client does connect to the server, but then as soon as the client
sends a command (USER or SYST),�the server closes the connection....

Help - I'm writing a GEM FTP client, and that's working well - but the
phone bill for debugging on remote servers is killing me, I really need the
local server up & running to save me time & money whilst debugging.

(I'm running mint-net0.55, mint1.12h2, minixFS0.6pl10 on a falcon030 4/32Mhz)

Craig.

2298. Atari Sparrow '030

Newsgroup: comp.sys.atari.st.tech
Date: 1995-05-31 00:00:00 UTC
From: Alias -X- <u943409@student.canberra.edu.au>
Message-ID: <Pine.SOL.3.91.950531190039.1920A-100000@student.canberra.edu.au>
Source record: 25967

I bought a "Sparrow '030"-Revision2 from Atari OZ just before they closed operations (they told me it was a Falcon). I managed to use its memory and hard drive (which crashed shortly afterwards) in another Falcon which I bought from Atari Beneluxe (sp?) in Holland. The Sparrow is now just sitting on my desk as a very expensive paperweight. I am wondering what can be done with it.

From the outside it looks exactly the same as a Falcon (with a Swedish keyboard) and has the same ports as the Falcon, but the borad is quite a bit different. The TOS chips (yes there are two) contain TOS 2.07. I've tried burning TOS 4.04 into a couple of eproms - but this didn't work. It has a DSP chip, and several graphics/sound chips which I can't identify. It also won't give out a proper signal to a VGA/MVGA monitor - the sync is totally out.

Can anyone supply information/advice on the possibility of upgrading it to a Falcon?

> Sorry for my bad english, but what's a POM?????

Ahh, don't apologise. It's slang in this part of the world (Australia
and New Zealand) for someone originally from England. It has it's
roots in Australia being used as a prison colony as it originally
stood for "Prisoner of Mother England" I believe. It is now a
semi-derogatory name for any English immigrant. The phrase a "whining
Pom" is fairly common description, when such certain people complain a
lot about how things aren't as good as they should be or were back
home.

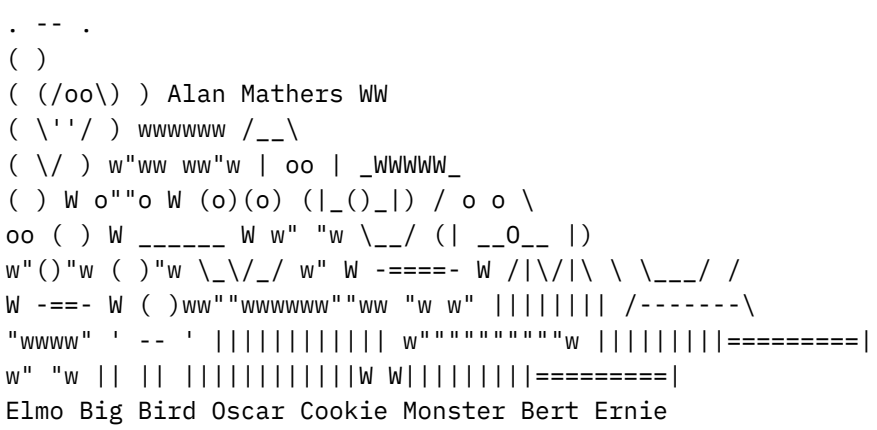
re: Some Info about the PAK3 and T28/T36

Thanks for posting this article, it has answered many questions. I still would like to know more, especially about the T28 and T36:



1) Installing the PAK3 seems a pretty major task to do, so are the T28 and T36 much easier to install? How does the procedure compare.

2) Apparently System Solutions have mentioned an add on board for the PAK providing better graphics etc. Is this the case for T28/36?

3) From your article, the T28/36 will be running a 68K much faster than it's intended speed, presumably introducing more heat - how does this affect performance, reliability, eventual failure??

4) Although I very nearly put in for a PAK3 from the SS stand at Atari User Show, (last November I think), you can probably tell I am now considering saving some cash and getting the T28 instead - providing it is reliable and really what I want!!! I only need to run Cubase and Replay16, so better graphics is not essential.

Thanks again..

I don't think they are difficult to find - Wangtek and Tandberg, among
others, still produce many types of SCSI-QIC-tapedrives (I have a TDC4120
1.2GB QIC drive and are very happy with that).

525MB SCSI-QIC drives are available from 500DM up in Germany from different
sources.

It was none other than Kim Andersen who did write on 28 May 95 that ....
>> Kim I think he is thinking of HOW_FAST which works on all Atari's ..
KA> including
>> Falcon ,don't know of its accuracy of course but it seems to give
KA> How_Fast doesn't give any graphiccal result, does it ? I havn't

It displays a "Graph" of what it is reading ..so in this literal sense it is graphical ...as oppossed to RateHD with gives only a figure (Somewhat inaccurate aswell). There maybe 'more' graphical displays but that doesn't mean that this is not 'graphical' ... oh maybe this should be moved over to alt.english.grammar or something :-)

KA> discovered that.. (well, it shows some linies ofcouse, but thats not
KA> what i think when speaking graphical). But an old program i have here

X-Y line diagram = Graph type diplay = graphcial ... :-))

KA> on my board does, and it's useless as it gives wrong results, and
KA> bombs on machines with Tos 1.6 and above. This program gives a real
KA> sprech sheet like result, with circles and stuff like that.

then it is not much good then :-/ You could of course save the results from how_fast (I know you can do this but I don't know exactly what it saves so this is not to be taken too seriously <grin>) and import them into Kgraph , process then export to Calamus if you really wanted 'MOST' graphical :-)

: > don't know if this has been asked before, but what would be involved in
: > making a little black box that would allow you to plug a PC serial mouse
: > into the ST mouseport?

: This can already be easily done, with no hardware adapter needed.

: A standard MicroSoft compatible serial mouse can be used in the regular
: ST mousport, but it needs a software driver.

: DMC Publishing, out of Toronto, sells such a driver, and it's my understanding
: that a similar driver is available for ftp from atari archive sites.

: A standard PC *bus mouse* can be used with no software drivers needed,
: but some slight modifications to the wiring of the connector are needed.

: There should be text files telling how to do this on the atari archive sites,
: and I know we have them in the Atari Forum on CompuServe.

: BobR

I don't think this will work... You can plug a serial mouse into the Atari
serial port. Therefore you will need a driver (I know of a driver
supplied with the AT Speed 286 emulator so that you could use your PC mouse
also with the Atari). I think the same is valid for bus mice except that
you need an RS232 adaptor.
The reason: Atari mice are "brain dumb", they just deliver a pulse code for
direction and movement and are suplied by the 5V line of the
joyport/mouseport. The IKBD has do do the work (calculate relative
movement etc.). PC serial mice need a real RS232. They deliver byte
sequences over the RS232. Since there is no free RAM area in the IKBD
you cannot write a driver to use PC mice on the ST mouseport! Such a
driver would have to reside in the IKBD RAM! Well it's possible but you need
another IKBD controller for that.

The PAK3 board can carry TOS2.06 in four Eproms thus making Rom access faster.
It does not have a special slot for a graphic card but one can plug the old
68000 processor and then toggle between the old and the new CPU. MW Electronic
in Germany sells a graphic board for the MegaST.

> experienced it at the time. Anything I can do about it?

Disassemble your Falcon and unscrew your harddisk from the motherboard,
then take some tape and place it between the mounting point where the screws
goes in and the motherboard. Than screw your harddisk back onto the motherboard.
The problem may be caused, by bad shielding between the harddisk-holder and
the motherboard.

> 3) Certain program, when they produce sound/music from my Falcon, cause

It was none other than -Unknown- who did write on 30 May 95 that ....
-> He has the Link and a SCSI hard disk and has been looking at the
-> cost of SCSI CDRoms. It seems that you pay a lot for the privilege
-> of having the power supply in the same box.

Not neccesarily ! Toshiba XM Triples and Quad externals are rebadged by loads of companies and they sell at the same price as internals. Try looking for a big boxshifting Discount AppleMac Seller for one.

-> So he wants to know if anyone has tried just sticking together a
-> power supply and an internal CD drive in a shoe box or similar
-> high tech enclosure.

I'm sure you could do that BUT you do your sums and an complete external works out cheaper and you don't have to waste time getting all the silly little bits that you always need and once its built you can move it without fear that it will stop working :-)

Source record: 25986

I have seen the Multiboard mentioned in several magazines, it is supposed to provide an IDE interface, sockets for TOS 2.06 & a slot for a PC Graphics Card.

Does anybody have any more information. like who makes/supplies it, what graphic cards work with it & what/where is the software to make it work, how much is it,etc...

The PAK 30 has the TOS 2.06 option (as a minimum) but does it provide any slots for graphics cards?.

I had similar problems, too, when I connected a SCSI drive to my Falcon.
The problems disappeared after applying a so-called Falcon patch which
fixes timing problems on the Falcon's bus system. This patch is a hardware
patch so you may contact your local Atari dealer to build it into your
Falcon.

You might also contact Michael_Ruge@wi2.maus.de (Michael Ruge) for a
description on how to do the patch yourself. However, I don't know whether
he has an English version of it.

All your problems point to a Power Supply going bad or just a loose
connection where the Power Supply plugs onto the Main Board.

Actually, I don't know what it is called. It is the device that makes you connect upto 7 SCSI devices to the ST. It is the one that is supposed to connect using the Atari ADSCI (?) port to the that, then hook up possible SCSI hard drives. I will be willing to pay for shipping + the item itself.

Thanks...RichWegner@AOL.COM

BV> installation in a ST1040, I have the external case so the
BV> power supply etc. is not a problem.

Buy the Link II by ICD and get a SCSI cable. You can order both from
Toad computers. Buy an internal SCSI CD drive. Stick it into the
case adn attach the SCSI cable to the drive and then to the Link II.
Attach the DMA cable to the computer and then to the other side of
the Link II. You are all set. Just get a program like Extendos and
you're in....

2323. MiNT w/o MultiTOS

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-02 00:00:00 UTC
From: sanders@sci.kun.nl
Message-ID: <D9JGtI.BKH@sci.kun.nl>
Source record: 25892

Hello,

Lately I've been trying to convince my Falcon that I want to run MiNT, but _not_ MultiTOS. I remember I've tried it before, but I gave up. I understand that I just have to comment out the line

#GEM=C:\MULTITOS\GEM.SYS

in my MINT.CNF, but when I do so (and have memory protection switched off) I get peculiar `mouse droppings' (i.e. an image of the mouse displayed upon moving, about one VGA screensize down right of the `real' mouse pointer (I'm using BlowUP)) and my system is _very_ unstable (as in: hangs after about 30 seconds).

What am I doing wrong? I also tried

INIT=C:\GEM.PRG

with the old GEM.PRG I had to use for MiNT in my old ST, but that doesn't help.

My setup: MH-MiNT 1.12h2, NVDI 3 (but the problem also occured before I had that), TOS 4.02, BlowUP 030 (but when I don't install that, the problem is still there).

Sometimes I wish for my old ST... There I could have a tcsh in a TOSWin window, or even more if my ST felt generous. I want that back, and not have to run MultiTOS as the Pure C editor then even loses characters at low typing speeds...

Help me out... I'm stymied!

Regards,

Great, but it will it be compatible with TOS 4.02 and 4.04? I have done a little
patch to stop the IDE wait, but it doesn't seem to work on 4.02, and I haven't
got a 4.02 machine to find out where to patch TOS!

I suppose you weren't lucky enough to have just fiddled with the right ones?
The actual ID selectors should be on a separate bunch of 3 pairs of jumpers
on the edge of the drive (At least, my Micropolis & Hitachi drives are
like this) and for a first SCSI drive, ID=0, should all be vacant/open/
not connected;
all the others should be left as they were!

This is a bird that neither I nor anyone I've spoken to has ever heard
of. I wonder if it might not be simply an STe (or, if the keyboard is seperate,
a MSTe) with some kind of 030 card installed. Strange that it would have a
Swedish keyboard.

My point exactly. These drive bear the Seagate label and much more
reliable than Seagate drives of old. They are more reliable because they
are made by companies that Seagate have aquired/done deals with.

They are still Seagate drives though. Therefore not all Seagate drives are
rubbish.

Sorry - but having blown 930Mb worth of SCSI disk drives this year - all
I can say is that sometimes they don't recover. Most of the time its just
an incorrectly placed jumper or lose cable. Doesn't seem to be the case
for you. :-(

:-)

Any info on how to speed up a TT too ? Currently I'm fiddling with a faster clock oscillator (40 MHz) but unless I hook it up as replacment for the 32 MHz oscillator, the TT won't boot up with the desktop. That is, all auto folder programs run fine if I just hook up the oscillator to the processor clock input pin, but as soon as the desktop should appear it bombs out. If connected in place of the 32 MHz oscillator it boots up fine including the desktop. Only then I can't use the mouse or floppy drive as the frequencies are too far off (they are all derived from the 32 MHz clock in some way -> 16 MHz, 8 MHz, 500 kHz etc.) I know there is such a thing as CaTTamaran but I read the info's in a demo program of this accelerator and the hardware seems quite simple so I wanted to try for myself :-)
Anybody tried to put in a 68040 or 68060 into a TT, will the TOS need patching, what do these processors cost nowadays ?

Gert

BTW I've created a simple hardware overscan modification for the TT which gives 832x500 in 16 colors on a VGA monitor (that is 'fullscreen' instead of the '75%' picture..) So now you can have 'real' 80 column windows! It consists of a multiplexer IC (for software controlled on and off switching) and a simple transistor circuit to generate a new 'DE' Display Enable signal.

How_Fast is the only testing program I know that

1) allows you to define the filesizes to be tested (eg. from 3 Kb to
3.1 mb, and in how many steps this test is made.
2) makes a graph that clearly shows the effect of disks thermal
calibration (try a test: 199Kb to 200Kb 500 times!).
3) saves the graph as data file that can be imported into for example
X-act business graphics package for more types of presentation.

Source record: 25918

> You have to remove the cover. On the main board You'll find the set of
> adjusters. Just try them with a small screwdriver.

This is true for the vertical adjustment, but the horizontal size (width) of the screen on the SM124 is controlled by a coil.. it looks like a small spool of thread, and needs a special plastic tool (available at Radio Shack) to screw the iron slug core inside the hole in the spool in and out to adjust the width.

The tool has a hexagonal head on it to fit into the slug, and needs to be plastic to avoid affecting the adjustment (the circuit is fairly high frequency, and a metal allen wrench could distort things), not to mention the adjustment has to be done with the power on, and poking metal things into high voltage is usually not a good idea..!

(The tool also has a screwdriver tip on the other end for making the vertical adjustments too.)

As was mentioned before though, if the picture has been shrinking, it's probably symptomatic of other problems.. adjusting might help for a while, but it may become more serious eventually.

Incidentally, there is a text file that was somewhat widely distributed when the ST first came out detailing how to enlarge the picture size on the SM124 to fill the entire screen, instead of having the wide black borders it normally comes from the factory with. This file gives the exact locations and markings of the components that need to be adjusted, and recommendations about the tools and safety considerations. I don't remember the exact filename, but it might still be available at Atari FTP sites.. probably in a "miscellaneous" directory.

We might even still have it in the Atari Forum on CompuServe...

> Could you post these instructions here, please? There are many of us here
> who have no access to Compuserve.

No problem.. it's fairly short. I haven't actually tried this myself, but
at least a couple of our Atari Forum members have done it successfully...

Remember that this is for a BUSS mouse, even though the author just refers
to it as a "MicroSoft Mouse". The PC serial mouse connector is the same
physical type as the Atari mouse uses, a miniature male DB-9.

BobR

Subject: How to hook-up a MicroSoft mouse to an Atari ST

Here's a repost of my article of wayyyy back (Feb 1989) on how to hook an
Microsoft mouse to an Atari ST. No software changes are required. All it
takes is creating a special cable between the mouse and the Atari.

I've been using a Microsoft mouse now for around 2 years on my 1040, with nary
a glitch. It's so much better than the Atari mouse, I'd never go back. (IMHO)

Well, here is how to connect a Microsoft Mouse to an Atari ST. (520/1040)
The Atari has a 9-pin D-type connector. The Microsoft Mouse has a rather
strange connector on the end. To prevent having to cut the mouse cable up,
I made this adaptor. If you still can't follow it, please let me know and
I'll try to redescribe it. This does work for me. I've been using it for
6 or so months now [Note, it's been 2 years now!] with no problems at all.
It does take some soldering skills, so if you're not so hot at soldering,
find a friend to help.

As far as I know, this does not effect your Atari's warranty. However, I
have not asked Atari.

Atari ST		Microsoft Mouse ST		expected signal
1	5	XB		
2	3	XA		
3	8	YA		
4	9	YB		
5	N/C	N/C		
6	2	Left button		
7	N/C	+5VDC	(N/C)	
8*	6	and also tie to pin 1	Ground	
9	7	Right button		

* = I am not sure why I have pins 6 & 1 tied together, but it does work.

The Microsoft mouse connector looks like this. This is the solder side,
with the leads pointing up.

```
---------------
| 1 |
| 2 3 4 5 |
| 6 7 8 9 10 |
| |
---------------
```

If you can not use the connector, the pins are numbered as follows. This
is the connector side from the Microsoft Mouse plug:

```
/------------\ This is a view at the front of the connector.
/ Blank "KEY" \ It is where the plug from the mouse would be.
/----------------\ The pin labeled 'n' is not connected.
| n 4 X 8 | The place labeled 'X' is filled, and does not
| 9 7 1 2 | have a pin.
| 5 6 |
\ /
\------------/
```

Have fun!

> But I think you mean the serial port. If you want to hook up a serial
> mouse to the mouse port you would need to do some major surgery.

I checked with Nathan Potechin of DMC publishing, and it turns out that the serial driver is indeed from Cybercube, the producers of the Cyrel Sunrise video card. Unfortunately DMC only distributes the card, not the other software products from Cybercube, so he couldn't give me any info about how the PC serial mouse connects to the ST when using this driver.

As for doing surgery, it depends. A serial PC mouse with a DB-9 connector should plug directly into the mouse port of the ST.. they use the same connector type (and that should include just about every serial PC mouse you're likely to encounter).

If it turns out the serial PC mouse needs to be connected to the ST's serial port instead of the mouse port, you would indeed need to convert the plug somehow.. but 9pin to 25pin adapters are easily available for a couple of dollars, so you shouldn't need to do surgery on the plugs.

The PC *buss* mouse *does* have a proprietary connector that would need to be adapted, or cut off and resoldered to a DB-9 that would plug into the ST's mouseport. It might actually be possible to use the cable from a dead Atari mouse to make such an adapter, or even possibly to solder the Atari cable to the mouse in place of the cable supplied with it.

I'll see if I can contact Cybercube and get more info from them about how the serial mouse connects to the ST...

(Meanwhile, I bought a "Best Mouse" for my ST from Best Electronics many years ago which works great, hardly ever needs to be cleaned, and "best" of all, is a direct replacement for the Atari mouse without adapters or drivers or anything... highly recommended..!)

Aha..! I guess that solves the mystery of where a serial PC mouse would
connect to the ST...

I was wrong to assume it plugs into the mouseport then. How do you handle
using the mouse for things like terminal programs though, where your serial
port (at least on an ST with only one serial port) would be connected to
a modem..?

> Sorry for my bad english, School is a long time ago ;-)

No problem there at all..! I wish everyone I knew here in the US spoke
English that well..

That should work just fine.. there's nothing special about "external" SCSI CD-ROM drives other than providing a case, power supply, and a connector on the back.

If you're not particular about looks, a ribbon cable out a hole in the back would work just as well as a separate connector.

A popular setup is to use an inexpensive PC style case, either desktop or mini-tower (which usually includes a more than adequete power supply and fan) to mount accessories like CD-ROM drives, hard drives and even external floppy drives to connect to an Atari ST computer.

Have you tried using an Atari formatting program that has an option to
write a MS-DOS compatible boot sector to the disk..?

The one I used to use was DCFORMAT from DoubleClick Software (who
unfortunately are no longer with us), but there are many others which
have this option.

I don't know if this would make a SingleSided disk compatible though..

Oops... not that it probably matters a lot, but the connector on both the Atari mouse and a serial PC mouse is a *female* DB-9. Must be I've got Friday night brain fade...

:)
BobR

(Oh, and I just realized there might actually be some "surgery" required to plug a standard DB-9 into the Atari mouse port since the standard plug has "ears" that stick out with screws to secure the plug into the connector. These protrusions would probably have to be cut off with a razor saw or something to allow the plug to fit into the Atari mouse port recess.)

Hi..

I called a local atari store to purchase the PAK68/3 board (Toad computers) and
surprisingly, they didn't feel confident enough in the product to sell it to me until they know more about it, so I decided to ask here for some of their concerns.

First, they did not know how to reliably run the PAK at 50 mhz. They are selling an optional 'buffer board' which is supposed to facilitate this but say they can't get any information on this procedure.

Second, I wanted a 68000 compatibility switch included and although they were told by their distributor (System Solutions) that this is possible, their technician was unable to make progress in actually doing the modification.

Also, does anyone know if Magic 3 can be put on roms and used as the on board OS? And finally, is their a PAK FAQ floating around somewhere as I see alot of questions from interested users being posted.

Thanks...

Jeff

Although I can not ignore the fact that I am yet a few steps away from a successful CD ROM installation I can tell you that ExtenDOS is good value for what it does for you, the just released v2.1 makes it even easier of an installation.

For the record, no I am not paid to say this, but what I would like is to know if anyone has had the problem I am having in not being able to get the DATA transfer to work, the Audio part of it works GREAT, ExtenODS really makes the Audio.ACC work with ease.

BVM.

2362. Re: .INF file > 4K with MTOS?

You are correct in saying that SHBUF doesn't work with Multi-TOS, but then it doesn't need to. Are you using an ST or Falcon? On the Falcon, you just need to use the LOAD INF option from the OPTIONS menu and select Newdesk.Inf. All your icons will be restored and the Desktop will work fine until you reset or power down. I often use this method and it works every time. I have no experience of Multi-TOS on an ST, so I can't advise what to do there.

Hello, I have an IDE hard disk installed into my
1040 STF 2.5Mb and it is working without problems.
Well I have to hard disks actually. Both CONNER 2.5'
(for notebooks) 20 Mb & 40 Mb.
My IDE controler comes from Germany (Hard & Soft)
I tried to use a 3.5' hard disk with out success, a year ago.
I am going to try again now that 3.5' are less power hungry.
In the installation of my 2.5' hard disks I met minor problems,
but both work OK now.

[snip]
> I can't be the only one that has problems with this.
[snip]

The maximum shell buffer size (DESKTOP/NEWDESK INF file) in TOS/MultiTOS
has three sizes :
1024 bytes (TOS 1.0, 1.02 aka ROM, Blitter TOS)
4192 bytes (TOS 1.4, 1.6.... TOS 4)
32767 bytes (MultiTOS)

Are you sure that your file isn't a bit "corrupt" somewhere? Or else it is
the well known bug (to the few MultiTOS users i am acquanted with).

The GEM AES included with MultiTOS has problems reading a new INF file
when one is already in RAM - AES 4.0 keeps some of the old file around.

File size of 6k... you must have a lot of icons or installed apps, or some
very long path names. Have you removed all installed apps which are not
currently installed? (The "Remove" button at the bottom of the "install
application dialog does this). Have you done the same for icons (this
dialog also has a "remove" button).

Try this :

1. Rename your NEWDESK.INF to NEWDESK.IN.
To be safe, create a copy under another name ("OLDDESK.INF"), so that if
it gets screwed up, you still have your old file intact. If you are
absolutely paranoid, you could always print it out... (20, 30, 40 pages
or so of it...)

2. Reboot
MultiTOS GEM AES will not be able to find "NEWDESK.INF", and hence you
will not get your desktop icons/windows set up.

3. (Optional) Save this "blank" desktop as "BLANK.INF".

4. Read in the "NEWDESK" file.
If everything is OK, then this was just a bad file.

Otherwise, repeat steps 1 and 2. Rebuild your desktop icons/installed programs. (It's tedious. And sometimes necessary).

The "VIEWER" application that came with MultiTOS can be a godsend here - just double click on your "NEWDESK.INF" file, select "show", and then you will be presented with the contents of the file in a movable, scrollable, sizable window.

Before doing anything drastic, look through the file. (According to the powers that be : "You are not supposed to understand the layout of the file, only the GEM shell is")

Having had to re-write my Desktop file (to fix errors made by other peoples installers) many times in the past, I have come to learn the layout of the Newdesk/Desktop file.

Briefly, look for the following signs of corruption/normality :
A. All lines should begin with a hash '#' followed by a letter. Any line that doesn't is generally deemed corrupt.
B. From the window placement lines (beginning with '#W'), all lines should finish with an at-sign '@'. Lines that dont are deemed 'malformed'.
C. Following the window lines, the "program extensions" block. This defines the filename extensions for executable programs.
D. After this, come the installed applications. Each application is listed, as well as a file extension that will cause the program to be autoloaded. There should be three hexadecimal numbers preceeding the program name. The first two I am unsure of. The third, gives program type, and the FunctionKey it is assigned.
E. After this come a list of your desktop icons. The first two numbers are the place on the screen the icon appears, and the third is the actual icon number (from the DESKCICN.RSC file). The fourth hexadecimal number 'FF' doesn't seem to mean much. After that comes the "Icon Letter" and then the Icon Label.
F. Following that are the icons that have been dragged from windows onto the desktop.
G. After all this, you have a jumble of lines based on whatever you did to your system. Installed applications/icons, drive letters and so forth. these all apear in the order that you did them.
H. MOST IMPORTANT : If the file does not end with the PC-DOS EOF (End-Of-File) marker, it will not be a valid desktop file. (some "lame" program installers mangle the file, and dont put the required "EOF" marker back at the end of the file. Find the length of the desktop file (using the Desktop "Show Info"). Get out a file-editor (Knife, or similar), open at the "Newdesk" file, go to the byte at that particular offset (or one before it if your program numbers from zero). See if the byte at that position is the value 26 (1A in hexadecimal). If not, find the nearest preceeding end-of-line marker (bytes of value "0D 0A" hexadecimal, in that order), and place a "1A" hexadecimal byte immediately after it. GEM will NOT read anything beyond that byte when asked to "Read INF".

This technique has saved me many times when an install program has mangled my DESKTOP.INF/NEWDESK.INF (GRRR!).

According to Atari World MagicMac needs a 030/040-based Mac to run. I'm not familiar with all the different Macs, what processor does the 405 have?

Besides, the OLD Lynxes stink. That $.02 part that the adaptor plugs into on the Lynx broke on mine, and I understand on a lot of other peoples' too. When I called Atari, they said they wanted $50.00 to fix it! I did a little snooping, and found that they don't even do that. They just send you a new Lynx, maybe not even the kind you had (IOW they'd send you a Lynx II).

I _love_ my Lynx (especially Zarlor Mercenary & Ninja Gaiden), but until they fix my Lynx for a fair price, I won't buy one. I wish someone would make a gadget so I could play my Lynx games on my Falcon (or even STe, I guess!). That would be great.

Just my $.02 worth :)

Source record: 25936

The latest in my seemingly neverending series of MiNT problems is that I can't get GDBM to work. I'm trying to compile "sendmail" with GCC 2.58 and decided to tackle the "praliases" program first of all. It makes several dbm_* calls so I downloaded GDBM 1.71 and installed the libraries. The code now compiles fine, but the dbm_open call refuses to open /etc/aliases (although it's there). I changed dbm_* to gdbm_* and now I get "access denied" instead. Is anybody actually using GDBM successfully? I wondered if the problem was anything to do with MiNT's file locking routines, but it happens under both 1.12h2 and 1.12h3.

2379. Falcon & Serial Port

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-05 00:00:00 UTC
From: maputman@hydra.unm.edu
Message-ID: <3qtnhn$ku3@lynx.unm.edu>
Source record: 25848

I have a Falcon 030 w 4/84. TOS v4.04, Ext. Control Panel v1.2, Modem CPX v1.30. In the control panel the Serial Port Box is always greyed out "Modem 1." Nothing in Auto Folder, unloading other/all CPX's or booting with only VT52 seems to make the serial port work.

Any suggestions? Modem works fine on Mega2ST as this attests. So is it the hardware?

Post back or email. Thanks in anticipation...

2380. Cubase Audio & Peavey SP/SX II

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-05 00:00:00 UTC
From: michaelk@pacifier.com
Message-ID: <3qtuac$8u7@news.pacifier.com>
Source record: 25849

I have been unsucessful for over a year in trying to get Cubase Audio
to record when I have my Peavey SP/SX II sampling unit in the SCSI
chain. I know my termination & I.D.'s are correct. I believe after
trying many combinations that the problem either resides with SP/SX
or the my Hard Drive.

Within 4 measures after I begin to record everything stops and I get
the Message: "HD SCSI Timeout check SCSI connections, ID's &
Terminations". ICD Pro indicates the problem this way:
"M SENSE: $29 (8,0)" which means "Power on or reset or bus device
reset occurred" with 8 being the ID for the 540meg.

My set-up:
is Atari-Falcon with 80 meg IDE to a Maxtor
230 meg SCSI to a Maxtor 540 meg fast SCSC II (this is the drive
I use for hard-disc recording -- using 2 230meg partitions) to 105meg
SyQuest to a Glyph cd-rom to the SP (BTW it is 25 pin) to finally the
SX (25 pin) which has to be one end as it is perminately terminated.
The 540 meg performance specs are:
Model MXT-540SL
8.5ms avg read, 9.0ms avg write
256KB buffer
6300RPM
transfer rates to 10Mbytes/sec

Now having everything connected as above allows me to play back
recorded material but NOT record, UNLESS I take the SP/SX II out of
the SCSI chain then everything works fine. My SCSI cabling is no more
than 8 feet in total length so that shouldn't be a problem. I've
changed replace cabling.

I should mention when I have the SP/SX connected to the SyQuest drive
or even with the full chain the SP/SX has no problems communicating
via SCSI with the SyQuest.

Has anyone else got experience with the SP/SX and Cubase Audio --
how does it work? Or could my problem be thermal recalibration which
only causes problems somehow with the SP/SX or maybe that drive
cannot handle that many SCSI items?? I just don't know....(help).

I have been playing around with the features of the later AES versions (like background operation, auto-shutdown etc.) but cannot get the Res-change mode of Shel_write to do anything useful.

Using Shel_write(5,...) I have got it to change resolution upon exit. But what use is this? I want a dynamic change of resolution... So I tried
Shel_write(1..)
to launch the program again, after it had exited. However it launched it before the resolution had changed...

Sooo.... Is it possible to do anything useful with this call?

Anthony

(Please respond via email, as I lose .net access for a couple of months soon)

When I use the printer driver below, it sends images to my [HP Laserjet IIIp] printer, but the print-outs are about the size of a postage stamp. Which of these parameters do I change to print out a full (i.e., 8.5" x 11") page as in EasyDraw or PageSTream?

(An identical problem occurs with MegaPaint Professional, but there are no ASCII printer driver files with that.)

Thanks!

Message-ID: <h54118.802365380@sakura>
Source record: 25860

Dear Falcon owners,

I have a Falcon Speed AT emulator for sale:

It has a 16 MHz 80286 CPU with a Norton factor up to 12 and
includes EGA/Vgamonochrome graphics emulation.
It runs Windows at 256 colors with a special driver (all included)
and reaches a quite satifactory speed in doing so!

It just plugs into the direct processor expansion slot of the Falcon -
all you have to do is remove a jumper blocking one of the rows of pins.
You can make one partition DOS bootable and the TOS partitions are fully
accessible for DOS too.

I used the emulator to port stuff written in PureC to TurboC, testing it
on the run and the same machine... Now however, I got a separate Pentium,
so I really don't need the Falcon Speed anymore...

I paid about DM 400.-- a couple of months ago (Deutsch Marks that is) -
offers are welcome; just drop me a mail.

Regards,

Christian Goltz

Hello,

I'm trying to find a description/diagram of the pin-outs for a
standard midi port. I no longer have my atari ST manuals and am
a bit stuck. I have the description of a 15 way pc sound card
style port but no 5 way din type diagram.
I know I could just go out and buy a cable but that would spoil
the fun of getting the soldering iron out!

Can any one help me please.

ps A direct email to simon@dvstsol.demon.co.uk would reach me alot
faster and be much appriciated. Thanks :) .

2393. WTB: TOS on ROM (Preferably in UK)

2394. ! Hard drive SOS !

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-06 00:00:00 UTC
From: evilandi@ability.org.uk
Message-ID: <9506060000.D2182LL@ability.org.uk>
Source record: 25863

I have recently bought a second-hand Reference 40 40Mb SCSI hard drive with ICD adapter. Sadly I have no utilities disk and neither has the original owner. I do have a disk with only ICDBOOT.PRG in the AUTO folder, plus a manual detailing the many goodies on the missing ICD utilities disk. There are no other programs supplied other than ICDBOOT.PRG. The ICD adapter would appear to be a cable with a 19-pin plug at each end, marked "ICD". Both ends of the cable are identical, as far as I can tell. There are no other programs supplied.

All my attempts to get my Atari 520STFM 1Mb with TOS1.02 to co-operate with this hard drive have failed.

To cap it all, I need a hard disk drive to get onto the Internet... at the moment I ONLY HAVE EMAIL via a BBS- no Usenet access at all!

If ANYONE has any advice, or can supply an ICD AdSCSI ST hard drive utilities disk, I would be most grateful. PLEASE EMAIL me, as I CANNOT read Usenet news. I will post a summary of replies if requested. I will pay European postage, floppy disk costs, and may even buy your ICD utilities disk off you. I will ring back anyone who telephones me with help.

Symptoms:

I start with my ST switched off.The hard drive comes with a seperate power supply, which when connected and switched on, lights up the red Power light on the drive, and the fan starts. I then hear the drive whirring into action. The Access light stays dim. If I wait with my ST still switched off, after about 2 minutes the green Access lamp lights and stays lit.

The hard drive has two ports marked DMA IN and DMA OUT. If I connect the DMA IN on the hard drive to the Hard Disk (DMA) port on my ST, switch on hard drive, wait 30 seconds and then switch on my ST with no floppy disk the drive, the green Access light stays dim and after 30 seconds the default GEM desktop appears. Any attempts to Install Drive as C, D, E, F etc. fail with Device Not Found.

I have a floppy disk with a program named ICDBOOT.PRG in the AUTO folder. With the DMA IN port on the hard drive connected to the Hard Disk (DMA) port on my ST, booting with this floppy in the drive gives the message "Hard drive not found".

If I connect the DMA OUT on the hard drive to the Hard Disk (DMA) port on my ST, switch on the hard drive, wait 30 seconds then switch on my ST with no floppy disk in the drive, I get a blank desktop with no icons and many of the menu options disabled- including the Install Drive option. This happens also if I try to boot with a floppy disk in the

drive.

ANY suggestions, hints, tips and especially offers of an ICD Utilities Disk most gratefully received by email or telephone. Once again, I CANNOT read Usenet news (until I have sorted out my hard drive...).

Alternatively, the address of an Atari ST user group local to me here in Cheltenham, Gloucestershire, UK would be appreciated.

Thank-you to anyone who can help in any way.

There's nothing wrong with your Falcon. What you need is HSMODEM6 from a popular FTP sight and install DRVIN.PRG and SCC.PRG (from the HSMODEM6 package) in your AUTO folder. Set them up to replace baud rates and you will have three possible selections for serial devices within most telecom programs. Use device 7 for the modem port and device 9 for the LAN port. My Falcon serial port is currently doing 115200 baud (which I have mapped in the 134 bps slot) with a 28800 bps v.42bis/v.34 modem.

The control panel does not recognize the Falcon LAN port and thus assumes only one port is active. Hence the reason for the selection being greyed out.

Hello, all.

Here is a diagram of my current set-up:

What I'm thinking about doing {1} is replacing the internal Maxtor 120 Mb SCSI HD with a 540 Mb SCSI-2 HD. The trouble is, the internal host adapter is the original default one that came with the MegaSTe back in December 1991 (before SCSI-2s were around). What do I have to replace in order to pop in a 540 Mb SCSI-2 HD? (Or, perhaps down the road, a 1 Gb SCSI-2 HD.)

Thanks!

- John

: FWIW I think MiNT-Net is the way to go for this kind of stuff, ok so it's a
: not a setup for the "non-techie" but a common base and "platform" for all
: apps to run under seems the best way to go to me.

It would be nice if someone would write an installation program and
bundle the entire pack onto a set of disks, or in one directory on
the net.

If I could actualyl understand how to set the thing up myself I could
be tempted to write the install program.

>Swedish keyboard.

From information given me from an Atari insider: the Sparrow was the
original name of the Falcon, developed in Israel. The name lives on in the
Falcon's DMA chip (SDMA = Sparrow DMA). The small-scale operation in Israel was
closed down, and development continued in America, eventually producing the
Falcon. I didn't know any Sparrows were ever sold, though.

It was initially intended to be an upgrade to the STE, with a 68030,
but then the idea of chucking a DSP on came along, and after that it became
a bit more than just an upgrade.

The machine being talked about here is probably one of the prototypes,
hence it not being fully Falcon compatable, but it IS a Falcon (of sorts),
not an STE.

From everything I've read, sendmail really sucks anyway... maybe you
should try using smail instead. From what I've heard, several people
have smail running well under MiNT.

> It makes several
> dbm_* calls so I downloaded GDBM 1.71 and installed the libraries. The code

> if the problem was anything to do with MiNT's file locking routines, but it
> happens under both 1.12h2 and 1.12h3.

Strange, strange. Although I probably compiled that GDBM you've got, I
can't claim to have tested it extensively. Basically, I built the test
apps that come with it, played with them, got the expected results, and
that was that.

Who owns /etc/aliases and what are its permissions? Are there any lock
files laying around anywhere from some other program? Good thing UNIX
provides three ways of file locking, it ensures that you'll have a hard
time figuring out what went wrong...

2403. HP 22707F FX-80 Emul Cart for DJ500

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-06 00:00:00 UTC
From: mpook@freenet.niagara.com
Message-ID: <D9rnIH.Dw3@freenet.niagara.com>
Source record: 25872

I have recently purchased a Hewlett-Packard DeskJet 500 printer.
It works fine, but not all my software supports this printer.
I understand that the HP 22707F Epson FX-80 Emulation Cartridge
is still available from mail order sources, including HP Direct.

Would someone who already has this Cart, please advise me if it
correctly emulates graphics modes of a FX-80. I would like to
use my DeskJet 500 with programs like Printmaster Plus, Print
Shop, and others that have graphics output but no printer driver
available for the DeskJet 500. Hewlett-Packard (Boise)
was kind enough to FAX me copies of the following documents;
"DeskJet Epson FX-80 Emulation ERS" and "Using the HP22707E
or HP22707F Hewlett-Packard EPSON FX-80 Printer Emulation
Cartridge". Both documents do not specifically state that
the cartridge will emulate Graphics Modes control codes,
but neither do they state that it is NOT supported. The local
HP Customer Information Centre and HP DIRECT Customer Support
(Mississauga) have been unable to answer my question.

Please respond via E-mail. Thank you.

2404. What's Happened to HENSA

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-07 00:00:00 UTC
From: John.J.Snape@Warton.bae.eurokom.ie
Message-ID: <C707ZVUIH4SIQ*@MHS>
Source record: 25873

=0D=0CHi People,

Does anyone out there have any idea what has
happened to the anonymous ftp access to the
atari archives at micros.hensa.ac.uk

I have tried several times to access the site
and have been denied access.

Have they turned off access, or just limited
the numbers.

Is the vast amount of atari stuff at hensa=20
mirrored at any other site or sites ?

Any info would be very useful..

Thanks in advance

John Snape

2405. Re: MagC Mac

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-07 00:00:00 UTC
From: grmeyer@mcs.com
Message-ID: <grmeyer-0706950657180001@grmeyer.pr.mcs.net>
Source record: 25874

I managed to get the MagiCMac demo working on a Color Classic (68030, 16mhz, 6mb RAM) so it's not too demanding.

Looks like a neat product, but too bad it doesn't work on a PowerMac....otherwise I might have bought it. :-(

Atari Web Pages Latest News
~~~~~ ~~~ ~~~~~ ~~~~~~ ~~~~

Version 1.0
~~~~~~~ ~~~

Date 6/6/95
~~~~ ~~~~~~

by

Mark Stephen Smith
~~~~ ~~~~~~~ ~~~~~

6th Update
~~~ ~~~~~~

================================================================================

Foreword
~~~~~~~~

Hello and welcome to the news item on the Atari Web pages. This document
will describe the Atari Web pages as provided by Mark Stephen Smith and will
inlcude a list of the latest updates for the month. Each month I hope to update
this text with the very latest additions and news on the Atari Web pages.

Hopefully these pages will provide an invaluable service to their users, but
they are still at an early stage and developing all the time. As such any
feedback and support you may have for these pages is more than welcome, it is
infact encouraged. The more input I get from its users the better, as then I
will know what is good and bad about these pages and can change them
approproately in the hope of increasing their value to their readers.

Now on with the show.

================================================================================

News and Changes
~~~~ ~~~ ~~~~~~~

Well since the original description a lot has happened. I'm now involved in
several projects, and submit work to several Internet and diskmag sources for
inclusion. I have also officially took over the maintenance of the Atari FTP
list from Hallvard Tangeraas of which there have been a couple of updates.

New items in this document since the last copy will be marked with **, updates
will be marked with a U. All new items are also listed below according to the
date they were added.
```

I apologise for the lateness of this update but my workload has been too large to take the time until now to do this. Please make a note of the sites new address and update any links or bookmarks to the Atari pages to the new address. Thank you!

The new items this month are:

2/6/95 -- Two Reviews of Checkered Flag added for the Jaguar
2/6/95 -- CAIN Newsletter Volume 2. No.4
2/6/95 -- HENSA Atari TOS Newsletter Volume 8. No.9. in HTML format
2/6/95 -- HENSA Atari TOS Newsletter Volume 8. No.9
23/5/95 -- Games Tips, Cheats and Solutions section added
23/5/95 -- Robinsons Requiems Tips
23/5/95 -- Iron Soldier All Weapons and Levels Available Cheat
23/5/95 -- Iron Soldier Unlimited Ammo Cheat
23/5/95 -- Comming Soon for the Jaguar Updated!
22/5/95 -- AEO Newsletter for Jaguar reporting on the E3 show in ZIP and text format
22/5/95 -- Falcon news section format altered so it links to Falcon Hensa newsletters rather than duplicating them here.
22/5/95 -- ST news section format altered so it links to TOS Hensa newsletters rather than duplicating them here.
22/5/95 -- Questions and Answers Q.3 answered, and Q.16 and Q.17 added
10/5/95 -- HENSA Atari TOS Newsletter Volume 8. No.8. update
10/5/95 -- Rod McCall's Falcon Pages link added
10/5/95 -- Bobby Tribble's Atari Link Directory Pages link added
10/5/95 -- Stuart Denman's (Author of Speed of Light) Pages link added
10/5/85 -- Promotional Video for Jaguar
10/5/95 -- Baldies CD Jaguar News
10/5/95 -- The Nordvic Atari Show 1995 Announcement
10/5/95 -- Fried Bits Coding Covention III Results
10/5/95 -- Freedom Fileselector Announcement
10/5/95 -- Substation News
10/5/95 -- Secret Level Codes for Hover Strike on the Jaguar
9/5/95 -- More Hover Strike reviews and comments for the Jaguar
9/5/95 -- Dragon : The Bruce Lee Story Review for the Jaguar
9/5/95 -- Small trick for Hover Strike on the Jaguar
9/5/95 -- Zool 2 cheat for the Jaguar
9/5/95 -- Jaguar FAQ update
9/5/95 -- Lynx FAQ update
4/5/95 -- Several Hover Strike reviews and comments for the Jaguar
3/5/95 -- Falcon Owners List by rod McCall
3/5/95 -- Falcon Developers List by Rod McCall
3/5/95 -- Falcon BBS List
2/5/95 -- 3 Demos each under 96K from the Fried Bits III Convention
2/5/95 -- Towers II: The Plight of the Stargazer Review by Mark Stephen Smith

==========

What are the Atari Web pages?
~~~~ ~~~ ~~~ ~~~~~ ~~~ ~~~~~
~~~~

These are a collection of pages covering all formats of the Atari. In these pages may be found the latest news, reviews, software for downloading, and various other information and links to other places of interest to Atari users.

I have tried to make the structure of these pages easy to follow and as intuitive as possible but there is still a lot of work to be done yet.

==========

How do I access them and what is the Web?
~~~ ~~ ~ ~~~~~~ ~~~~ ~~~ ~~~~ ~~ ~~~ ~~~

First of all I shall look at what the Web is or to use its full name the World Wide Web. The Web is new way of accessing the Internet, unlike previous methods where you were required to enter commands into the program you were using the Web uses a more user driven method of getting around the Internet. This method is much more graphical than former methods and as such is much easier to get to grips with.

When using a Web browser (the name given to a program used to access Web pages) the control method usually consists of a point and click operation. A Web page will consist of text and graphics which are sometimes highlighted in some way to indicate that they are selectable and link to more information or a particular piece of data.

Such a link is reffered to as a hyperlink. In fact the whole system is a variation on hypertext and uses a script to create each page. Each script is written to a HTML (HyperText Markup Language) standard which contains the main body of text in the page and a few command tags for the browser as to how to format the page and what to do with links, etc.

Web pages may contain text, graphics, sounds, and animations, although the later two are normally supported through external software. It is also possible using the Web to gain access to newsgroups, ftp sites, and gopher services all through the one program. As such this makes this a very powerful tool for Internet access, and coupled with its ease of use this has suddenly became the big thing in the recent Internet explosion into the media.

Browsers can handle all properly written HTML scripts but may vary in operation when scripts are incorrect or contain mistakes. Browsers can be divided into to distinct types, graphical and text only. Popular graphical browsers include NCSA's Mosaic and the recent new browser NetScape. On the text side Lynx is the most popular textual browser (NOTE: text browsers don't show any form of graphics).

To access the Web you must either use one of the above mentioned browsers on a machine such as a Sun, PC or Mactintosh, or if you want to access it via your Atari you will need a copy of the Lynx browser as unfortunately there aren't any graphical browsers YET for the Atari.

==========

Where do I find the Atari Web page?
~~~~~ ~~ ~ ~~~~ ~~~ ~~~~~ ~~~ ~~~~

From your Web browser choose to open URL and enter the following address:

http://www.mcc.ac.uk/~dlms/atari.html

If you can store a hotlist of addresses or something similar on your browser then it may be worth including this address for quick access in the future.

Once you've done that you should see my main page so I hope you enjoy it, and don't forget to write with your thoughts.

(*NOTE*: This is the new site for the Atari Web pages, take note of it!)

==========

U What you will find in the Web pages every month.
~~~~ ~~~ ~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~ ~~~~~ ~~~~~

From the main menu you have several links available to you, some under miscellaneous and others specific to a particular machine, or collection of machines. It is now possible to mail me directly from the Web pages, special thanks also to Frank Charlton for the new Atari Logo. First I will look at what will be in the Miscellaneous section.

****

Atari Related links, Documents, FAQ's and Newsletters
~~~~~ ~~~~~~~ ~~~~~ ~~~~~~~~~ ~~~~~ ~~~ ~~~~~~~~~~

First in the list are "Atari Related Links", these links are to other sources of Atari information or data (such as files, etc.).

There is a link to many of the major Atari holding FTP sites on the Internet. Links to several Web pages by different people on the Atari. This will grow as worthwhile sites come up. At the moment you can visit:

- HENSA to download Atari files (Moderated by Denesh Bhabuta)
- ZFC's Atari Pages by Annius V. Groenink. This has links to various Atari related places, along with talk of his own work on Edith and his new Drive U Project. Annius is also working on a version of the Mosaic browser for the Atari and the best of luck goes to him on that.
- Christer Gustavsson's Atari Gem Programmers Page. Very useful information for programmers grapling with Gem and the operating system. Also offers help via his questions answers page. Some links can be found to Atari related places.
- CAIN Atari Pages. CAIN is the Central Atari Information Network and they create a newsletter which is updately monthly on all things new to do with the Atari. There are also links available here.
- Martin Maisey's Atari Pages. Contains information (downloadable) on programs written by himself for the Atari. Again there are links to other Atari places.
- Toad Computers Pages. Stockiest and retailer of many Atari goods.
- ST Format Pages. Information and previews of ST Format issues.
- Volker Burggraf Atari Pages (German).
- Desert Star Software Home Page.
- ST Assembler Page
- BSM's Home Page

- ST Beer Mat Page
- The Organised Chaos Licenseware Home Page
- Index of /~jschlich/Jaguar/
- Lynx Pages
- Atari Lynx Page
- Atari Page by Frank Post (Partially German, partially English)
- MiNTOS Distribution and Information Page
- Julian's Atari Page
- Atari Ghostscript
- Atari Page by Robert Krenn
- Simon Gornall's Atari Pages
- Ben Halls Page (KSculpt + Calamus Information)
- "Data Uncertain" Software
- Kay's Home (MintNet)
- CNAM Atari Pages
- EMAGIC Users Page (Covers Atari)
- Helmut's Project contains Atari Links (English and German)
- Eero Tamminen's Atari Pages
- Atari Programmers Page
- Atari Users List
- Impulse Home Page (Demo Crew)
- NPG Home Page (Demo Crew)
- Atari Page by Dirk Klemmt
- Steve's Atari WWW Pages
- The Guitar Reference (For the Atari)
- Musings of an Amateur Hacker
- The Atari Home Page by Martijn Dekker
- Tecnation Sonovista (Falcon based computer)
- Cybercube WWW Page (Atari Products)
- Yak's Zoo
- Atari Jaguar 64-Bit Game Machine Stuff
- 8 Bit Atari Page by Ivo van Poorten
- Atari Jaguar Homepage by Christian Svensson (very good and kept up to date)
- Jaguar directory
**Stuart Denman's (Author of Speed of Light) Pages
**Rod McCall's Falcon Pages
**Bobby Tribble's Atari Link Directory Pages

Documents
~~~~~~~~~

Useful documents will appear in here. At the moment there is:

- Atari FTP List by Mark Stephen Smith (essential for the latest news on who provides Atari FTP sites).
- Atari TOS Desktop Survival Kit by Thomas J Hopper. An essential guide to getting the most out of your DESKTOP.INF and NEWSDESK.INF files.
- Recommended list of software for the Atari by Denesh Bhabuta. List compiled by Denesh for me of his best software for the Atari (updates coming soon). Mostly PD and Shareware, this list contains links to download most of the software mentioned.
~~~~~~~~~

- Information on picture formats by Dave Bagget. Lots of information on the format of different picture files for the Atari.
- Information on Viruses.

FAQ's (Frequently Asked Questions)
~~~~~ ~~~~~~~~~~ ~~~~~ ~~~~~~~~~

Useful FAQ's will appear here. At the moment there is:

- Atari ST SLIP FAQ. This is a guide to connecting your Atari to a network. All you want to know about networks and the Atari.
- Atari CD FAQ. Information on getting and using CD's on the Atari. Regular updates to this can be found in my pages.
- GDOS FAQ by Gerd Castan. Got a question on GDOS then this is the place to look.
- MiNTNet FAQ by Christer Gustavsson. Everything you wanted to know about MiNTNet.
- AtariNOS FAQ by Frank Charlton. Answered questions and information on NOS.

Newsletters
~~~~~~~~~~~

Although there may be more to come the following newsletters are updated promptly as I receive them. These have been re-organised to make it easier to keep track of. At the moment there is:

U CAIN Newsletter containing the latest Atari news.
U HENSA Newsletter containing the latest updates to the HENSA Atari archive.
**The HENSA newsletters are now available in HTML form also.
U AEO Newsletter containing the latest Atari news.

Newsgroups
~~~~~~~~~~

Atari related newsgroups. Send updates. The currently supported news are:

comp.binaries.atari.st
comp.sys.atari.advocacy
comp.sys.atari.announce
comp.sys.atari.st
comp.sys.atari.st.tech
comp.sys.atari.programmer
rec.games.video.atari
alt.games.lynx

****

U Questions and Answers
~~~~~~~~~ ~~~ ~~~~~~~

Submit your questions to here and get them included in this page. Answers are open to anyone who has something valid to say, and help is provided to me on Programming and Music questions by several knowledgeable sources. Please support this section, only by your interaction and questions will it survive.

All answers are included in this page for anyone else with the same question and answers are also sent back to the person who submitted the question for those without Web access.

If you feel you have an expertise in a particular area concerning the Atari and would be willing to answer questions on that area when and if I submitted them to you, then please let me know and you can join the team. Programming and Music are fairly well covered and I can cover Graphics programs, help with Technical questions would be appreciated.

****

Reviews
~~~~~~~

Here I hope to include reviews of Atari products both new an old. So far I have the following reviews:

- Kobold review by Andy Curtis (ST Format)
- Flash 2 review by Frank Charlton (ST Format)
- Edith Professional review by Frank Charlton (ST Format)
- MagiC review by Andy Curtis (ST Format)
- Stello v2 review by Mark Stephen Smith (Myself)
- Sportster Modem review by Frank Charlton (ST Format)
- Storm Tracker review by Andy Curtis (ST Format)
- Connect review by Frank Charlton (ST Format)
- Zero 5 review by Frank Charlton (ST Format)
- MIDI Grid review by Andy Curtis (ST Format)
**Towers II: The Plight of the Stargazer Review by Mark Stephen Smith

There are several reviews on the way by the above mentioned people aswell as some by myself. This section is now growing well now and Nick Peers from ST format recently expressed his interest in writing some reviews also.

Again if you feel you would like to submit reviews for inclusion then please write to me. Please note these pages don't include Lynx and Jaguar Reviews, as they are contained within their own pages.

****

News and Announcements Pages
~~~~ ~~~ ~~~~~~~~~~~~~ ~~~~~

Latest Atari news, and announcements from the Atari World. Currently contains the following:

**The Nordvic Atari Show 1995 Announcement
**Fried Bits Coding Covention III Results
**Freedom Fileselector Announcement
**Substation News
- Nova Graphics Board Announcement
- Sozobon C Announcment
- FTP site Announcment
- Fried Bits Eastern Coding Convention 3 Announcement

- Portfolio Club Announcement
- Towers II release Announcement
- Universal Virus Killer Book Announcement

****

**Games Tips, Cheats and Solutions
~~~~~ ~~~~ ~~~~~~ ~~~ ~~~~~~~~~

This is a new section introduced to help the Atari gaming community. It covers all Atari formats but is currently divided into the following areas:

Atari Computers
~~~~~ ~~~~~~~~~

Tips and cheats for all Atari computers. Cheats included are:

**Robinsons Requiems Tips

Atari Jaguar Console
~~~~~ ~~~~~~ ~~~~~~~

Tips and cheats for the Jaguar. Cheats included are:

**Iron Soldier All Weapons and Levels Available Cheat
**Iron Soldier Unlimited Ammo Cheat

Atari Lynx Console
~~~~~ ~~~~ ~~~~~~~

Tips and cheats for the Lynx. This section is currently empty.

Submission of game tips, cheats and solutions for any Atari format are welcomed and should be mailed to me.

****

Updates and Information on these Web Pages
~~~~~~~ ~~~ ~~~~~~~~~~ ~~ ~~~~~ ~~~ ~~~~~

All updates and news on the Atari Web pages goes in here. Previews of whats to come soon are included and new items or updates to the pages are listed according to date with the most recent being first. Most updates contain links to the new material for instant access.

Other things to be found in here are the number of accesses to the Atari pages. At the moment this is not supported.

****

This now concludes the Miscellaneous section. Now onto the Other Pages. These pages are specific to a particular machine, or collection of machines. These are going to go through some major changes and you can expect a fair number of changes to be made to these in the next month or so.

****
~~~~~~~

Falcon Page
~~~~~~ ~~~~

This will contain information and files relevant to the Atari Falcon, currently this page is divided into the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

In here expect to see any news or previews that come my way, whether they be small descriptions or full features with pictures. At the moment there is:

- Pinball Dreams and Llama Zap News.
- Apex News. This contains some information I got on Apex Media for the Falcon when I spoke to Douglas Little on the phone a few weeks back. Not very detailed unfortunately, but I'm waiting on my copy of Apex to give a full review so expect that to be rectified soon.
- Dextrous News. Small description of some of the features of Dextrous with a picture. Only at an early stage of development, if I hear more it will go in here.
- Towers II : Plight of the Stargazer. Pictures and description of this great looking Falcon only sequel to Towers. Expect the demo soon.
- Towers II : Plight of the Stargazer Update! The latest news on developments.

HENSA Atari Falcon letters are no longer duplicated and held in this area. Instead there is now a link from this page to the HENSA Atari Falcon Newsletter page.

Misc
~~~~

Miscellaneous information on the Falcon, including:

- Falcon Demo FAQ. List of Demos for the Falcon, including some form of information on each.
- Compatibility list of games with Falcon.
- Compatibility list of applications with Falcon.
- Falcon Specifications and Information compiled by Rod McCall.
**Falcon Owners List by rod McCall
**Falcon Developers List by Rod McCall
**Falcon BBS List

New Software
~~~ ~~~~~~~~

The latest Falcon/enhanced software available for download. Major revisions to be done with updates here. All files now list there size so you can see how large they are before downloading. At the moment the following software is included, with more to come:

**3 Demos each under 96K from the Fried Bits III Convention
- Apex Media Demo (Demo version of the animation and art package for the Falcon)
- Towers II (Shareware game)
- Super Bomber Man (freeware)
- Play MPEG v0.70 by M.D.Griffths (shareware)

- Speed of Light v3.8 (shareware picture viewer)
- Scape a planetary landsacpe generator.
- Digital Tracker demo of commercial version.
- Obsession 1 level demo.
- FOG issue 8 diskmagazine for Falcon.

Other software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth using on the Falcon.

- Backward v2.52. For compatibility with the ST. Please send any versions
which are newer than this.
- MultiBlow. Configurable overscan utility.
- Starball. Excellent pinball game (Falcon enhanced).
- Berzerk. Excellent version of Berzerk (Faster on Falcon).
- FOG issue 7 diskmagazine for Falcon.
- FOG issue 6 diskmagazine for Falcon.

****

Atari ST/STE/TT/Mega STE Page
~~~~~ ~~~~~~~~~~~~~~~~~ ~~~~

This will contain information and files relevant to all the above mentioned
Atari formats, currently this page is divided into the following areas:

News
~~~~

In here expect to see any news or previews that come my way, whether they are
small descriptions or full features with pictures. At the moment there is:

HENSA Atari TOS letters are no longer duplicated and held in this area. Instead
there is now a link from this page to the HENSA Atari TOS Newsletter page.

New Software
~~~ ~~~~~~~~

The latest (most recent versions) software available for download. Major
revisions to be done with updates. All files now list there size so you can see
how large they are before downloading. At the moment the following software is
included, with lots more to come:

- Speed of Light v3.8 (shareware picture viewer).
- ST Zip v2.6. Latest version of ST Zip.
- Obsession demo. 1 level of this great pinball game.

Other Software worth having
~~~~~ ~~~~~~~~ ~~~~~ ~~~~~~

Software worth having on the Atari.

- Utopus. Two player shootem' up (STE only).
- Ozone. Good platform/puzzler.
~~~~~

- Starball. Excellent pinball game.
- Berzerk. Excellent version of Berzerk.

****

Lynx Page
~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News
~~~~

News on the Lynx and related material. At the moment there is:

- Lynx Summer Steal Deal Extended to the Fall. News of price reductions for a limited period.

Reviews
~~~~~~~

Reviews for just about every Lynx game ever released will appear in here. All reviews are by Robert Jung. At the moment the following reviews are included:

APB Awesome Golf Baseball Heroes
Batman Returns Basket Brawl Bill and Ted's
BlockOut BattleWheels Blue Lightning
California Games Checkered Flag Chip's Challenge
Crystal Mines II Dino Olympics Dirty Larry:Renegade Cop
Dracula the Undead Double Dragon Desert Strike
Electro Cop European Soccer Chal. Ultimate Chess Chal.
Gauntlet:3rd Encounter Gordo 106 Hard Driven'
Hockey Hydra Ishido : Way of Stones
Jimmy Conners' Tennis Joust Klax
Kungfood Lemmings Lynx Casino
Malibu Bikini Volleyball Ms.Pac-Man
NFL Football Ninja Gaiden
Ninja Gaiden III : The Ancient Shop of Doom

Other Lynx Stuff
~~~~~ ~~~~ ~~~~~

Other items of interest to Lynx owners. At the moment there is the following:

U Lynx FAQ
- Lynx Tips and Tricks

New Software Anouncement
~~~ ~~~~~~~~ ~~~~~~~~~~

Currently empty.

****
~~~

Jaguar Page
~~~~~~ ~~~~

All the latest news and reviews on the lynx, along with cheats, etc. This page is divided in to the following areas:

News and Previews
~~~~ ~~~ ~~~~~~~~

All the latest news and preview information I can find related to the Jaguar.

**Baldies CD Jaguar News
- ECTS News
- Hyper Image page linked to (Makers of Jaguar game Hover Hunter).
- Jaguar CD Specifications
- Rebellion Development News
- Sinister Developments News
- Sensible Soccer News
U Coming Soon!
- Hand Made Software News

Reviews
~~~~~~~

A collection of reviews from different sources, hopefully I will be contributing more to this section myself. This page has been re-formatted thanks to Holger Kipp. Reviews so far include:

Aliens vs Predator - by Eric S.Boltz
Aliens vs Predator - by Robert Jung
Brutal Sports Football - by Randy
Bubsy Bobcat (in Fractured Furry Tales) - by Robert Jung
Checkered Flag - by Robert Jung
** Checkered Flag - by Eric S. Boltz
** Checkered Flag - by Tom Georgoulias
Cannon Fodder - by Holger Kipp
Cybermorph - by Robert Jung
Doom - by Robert Jung
Dragon: The Bruce Lee Story - by ?????
** Dragon: The Bruce Lee Story - by Joe Cataudella
** Hover Strike - by Jermey Haines
** Hover Strike - by Larry Tipton
** Hover Strike - by Scott R. Marrison
** Hover Strike - by Andrew S. Wheat
** Hover Strike - by Robert Jung
** Hover Strike (Comments) - by Dr. Moze (Steve Marsh)
** Hover Strike (Comments) - by Kevin Haley
** Hover Strike (Comments) - by Robert Jung
** Hover Strike (Comments) - by Jonathan J. Hunt
** Hover Strike (Comments) - by Sal Manfredonia
** Hover Strike (Comments) - by Sal Manfredonia
Iron Soldier - by Robert Jung
Iron Soldier - by Holger Kipp
~~~~~~~

Raiden - by Robert Jung
Syndicate - by Holger Kipp
Tempest 2000 - by Robert Jung
Theme Park - by Holger Kipp
Theme Park - by Robert Jung
Trevor McFur in Cresent Galaxy - Jer Howitz
Val d'Isere Skiing and Snowboarding - by Robert Jung
Wolfenstein 3D - by Robert Jung
Wolfenstein 3D - by ?????

There are many more reviews to come.

Other Jaguar Stuff
~~~~~ ~~~~~~ ~~~~~

Miscellaneous information on the Jaguar. Information included presently is:

U Jaguar FAQ
- Raiden Tips
- Jaguar Game Cheats
- Kasumi Ninja FAQ
- Ultra Vortex FAQ update for Jaguar
- 50/60 Hz, games adjusting to resolutions list
- Jaguar Game Cheats
- More Raiden Tips
- Kasumi Ninja Moves List
**Secret Level Codes for Hover Strike on the Jaguar
**Small trick for Hover Strike on the Jaguar
**Zool 2 cheat for the Jaguar
**Promotional Video for Jaguar

Other Jaguar Pages
~~~~~ ~~~~~~ ~~~~~

Other pages specific to the Jaguar included in here. Currently there is:

- Atari Jaguar Homepage by Christian Svensson

There are others that will be included, some containing more recent news, but
the one above is the most organised and intuitive one I've came across.

****

8 Bit Atari Page by Ivo van Poorten
~ ~~~ ~~~~~ ~~~~ ~~ ~~~ ~~~ ~~~~~~~

Not maintained by me these pages cover the 8 bit formats of Atari machines and
are very comprehensive. Nearly everything you could hope to find is contained
within these pages.

****

What to expect in the future
~~~~ ~~ ~~~~~~ ~~ ~~~ ~~~~~~
~~~~

Some structural changes are likely to appear in the next months. I have introduced an announcements page where you can tell the World of anything you have to announce. Please send news of updates to your programs, Atari stuff for sale, and any other Atari announcements here (NOTE : Commercial companies should send information on products to be included in here and in the news sections).

This month saw the introduction of the games Cheats, Tips and Solutions area. Currently this is fairly empty but will grow, your support would be welcome. This section covers all Atari formats including the 8 bit machines and consoles. It is currently split into Atari computers, the Jaguar and the Lynx areas.

In the near future I will be adding a Portfolio section to cover the portable computer by Atari called the Portfolio. This area will be supported by Jan Sedlak of the Portfolio club.

There is an outside possibility of starting a programmers and/or MIDI section in these pages but this is as yet undecided. I will judge whether or not to do this based on the kind of response I have. I do not want to repeat any of the good work done in these fields however by other Web page writers such as Christer Gustavsson (Where is the response for these pages?)

More support is needed for the questions and answers pages, although initially successfull people just stopped posting their questions. Although the odd one is still coming and answers are still forthcoming. Please support this, it is of benefit to anyone who uses it.

The Jaguar section should have a lot more news, pictures and reviews in the future. I have tracked down a fair bit of news and am in contact with a few companies now and hope to get news from them on there products.

Both the ST and Falcon sections should contain much more news in the future, along with more of the best PD/Shareware, and PD/Shareware reviews. I should have several demos hopefully in the near future for games coming out on these formats.

The Lynx section is to continue to get reviews and I will update the news as and when I get it. Sorry about the lack of updates recently, more to come.

Expect more links to Atari related pages in the future. There will be more newsletters, documents, and updates to the FAQ's.

Expect further reviews from Andy and Frank, along with myself (watch out for the Speed of Light review). Hopefully I can include more screenshots, and do a few program tutorials. Nick Peers of ST Format and Holger Kipp have offered to support these pages with contributions in the future.

Please write with your ideas, critisms, comments, submissions (software, news, reviews, questions, etc), to me and don't forget that I am now the official maintainer of the Atari FTP list originally by Hallvard Tangeraas. All updates to this list should now be sent to me.

Thank you and see you with the updates to these pages next month!

Hi,
My dealer just sold me a hard disk with Linux preinstalled for my TT (thanks OxoConcept!).
He tells me that I can only connect to the Sun next door via my modem1/serial 1 ports - which seems crazy given that serial2 is so much quicker. Is this true? Or, if not, what can I do to use serial 2?
tia, Mike Morris

Definitely untrue. I know we're not monkeys, 'cos up in Teesside, we used to
hang 'em (anyone from Hartlepool reading this?)

GNU C++ works great fine. You might also like to try out my GEM++ class
library. Note that I don't do much Atari programming these days, but I
will be releasing a final version of GEM++ eventually. All sources are
available. Look for "gem++" in index files of your favourite Atari FTP site.

Hi Atarians!!!

Hi, my friend and I are just about to mount a TT and a Falcon in PC
tower cases.

If any one has done the same thing or has any similar expereinces I
would be grateful for details or tips to make the whole job go smoothly!!!

Thanks in advance!!!

You could write drivers for the scc-chip. Many people would love you for that
;-). I think that there is someone working on such drivers, though.

Message-ID: <3r586u$jk7@prime.mdata.fi>
Source record: 25882

g> Are you sure that your file isn't a bit "corrupt" somewhere? Or else it is
g> the well known bug (to the few MultiTOS users i am acquanted with).

Quite sure. It was reassuring to know that MultiTOS can manage big
newdesk-files. Too bad that the Desktop doesn't...

g> The GEM AES included with MultiTOS has problems reading a new INF file
g> when one is already in RAM - AES 4.0 keeps some of the old file around.

Yes, I have noticed that I can manually load the newdesk.inf file
from the desktop. If I don't do it it, it doesn't get loaded correctly
I think it just loads the first 4192 bytes. For this I wrote a program
that loads automatically the newdesk file in the memory, so that the
desktop comes up correct right away. Unfortunately I started having
troubles with this. For example, the machine hangs if I have no windows
opened and I put my mouse pointer to the Desk menu. Some other random
hang ups occur sometimes also.

g> File size of 6k... you must have a lot of icons or installed apps, or some
g> very long path names. Have you removed all installed apps which are not

I have some, but all of them are essential. And I've done the cleanup
many times.

g> Having had to re-write my Desktop file (to fix errors made by other
g> peoples installers) many times in the past, I have come to learn the
g> layout of the Newdesk/Desktop file.

I've had some troubles too. The most amazing was when I had cleaned
the newdesk file with editor (I think I used 7Up) and after I had
saved it all my hotkeys were wrong! After many hours of pain I
found out that the line beginning with "#d" has to have the
exact number of spaces after it, otherwise it's corrupted! And 7Up
had removed the spaces!

s> use the LOAD INF option from the OPTIONS menu and select Newdesk.Inf. All

I use Falcon. And I had noticed that you can load the inf file from the
options menu. But it's just a way too much trouble to load it every
time you boot. I wrote a program which did that automatically for me,
but then started the trouble. I guess I have to look if there is something
wrong with my program, but I doubt it :-(.

There is the MiNT Distribution Kit by Simon Gornall of course, but it's a
little out of date now.

I'm not sure what it includes but it comes on something like 10 disks.

> If I could actualyl understand how to set the thing up myself I could
> be tempted to write the install program.

There is a faq on how to set up all the MiNT stuff and related programs, the
last version I saw wasn't finished but it looked good so far.

j>First, they did not know how to reliably run the PAK at 50 mhz. They are
j>selling an optional 'buffer board' which is supposed to facilitate this but
j>say they can't get any information on this procedure.

Well ... it seems to be a bit of a problem, sometimes. There are lots of
german users who report that their PAK works with 50 MHz, although some PAKs
simply won't (even with the buffer board). The buffer board can improve 50MHz
operation, but some PAKs work well without.

It seems that the new PCB layout version works better than the old one.

j>Second, I wanted a 68000 compatibility switch included and although they were
j>told by their distributor (System Solutions) that this is possible, their
j>technician was unable to make progress in actually doing the modification.

The new PCB simply needs an additional GAL fitted - all necessary connections
are there. On my PAK (the old PCB version, selfmade short after the article
came out), some additional flying wires are needed - but they are described
in the c't article and in the socs which you get from MW electronics (they
build the PAK) when you buy PCBs from them.

j>Also, does anyone know if Magic 3 can be put on roms and used as the on
j>board OS? And finally, is their a PAK FAQ floating around somewhere as I
j>see alot of questions from interested users being posted.

There was one in the german maus.sys.atari.hard group, but I don't have it.

My PAK (68030, 36 MHz) worked like a charm from the beginning - cache,
(patched) TOS 3.06 in ROMs, even my selfmade M110-megabus-adapter (monochrome
1280*960 card) works fine. I would strongly recommend using the patched TOS
3.06 instead of 2.06 since 2.06 does not initialize the MMU correctly.

Source record: 25889

Alan Mathers (alan@browns.co.uk) wrote:

AM> 1) Installing the PAK3 seems a pretty major task to do, so are the T28 and T36
AM> much easier to install? How does the procedure compare.

In most computers, the PAK ist pretty much plug-and-play ... you may need an
additional pullup on the reset line or have to exchange the LS373/LS244 DRAM
drivers, but the same is true for every other speeder, too. If you want to
run the PAK at 50 MHz, a bit more fiddling may be necessary, but ~40 MHz (I
have 36. using a 33 MHz 68030) should be safe.

AM> 2) Apparently System Solutions have mentioned an add on board for the PAK
AM> providing better graphics etc. Is this the case for T28/36?

The Mega4000 is a normal megabus(or processor socket)-to-VGA-card-adapter -
it might work with the Txx, too. It is not a builtin feature of the PAK, so
you don't have to pay it if you don't need it.

AM> 3) From your article, the T28/36 will be running a 68K much faster than it's
AM> intended speed, presumably introducing more heat - how does this affect
AM> performance, reliability, eventual failure??

That is not yet known ... I know 2 friends who had one and could not get them
to work reliable, and finally built themselves a PAK - but that may not be
representative. I have heard more complaints about problems with the Txx than
with the PAK, though.

AM> 4) Although I very nearly put in for a PAK3 from the SS stand at Atari User
AM> Show, (last November I think), you can probably tell I am now considering saving
AM> some cash and getting the T28 instead - providing it is reliable and really what I
AM> want!!! I only need to run Cubase and Replay16, so better graphics is not
AM> essential.

It depends on the speed you need. Furthermore, with the PAK you can use
virtual memory (VRAM/Outside) and maybe Linux-68k (when the necessary patches
are made).
If you need the 68881/2 coprocessor, the PAK is a good choice, too - the
MC68030 FPU interface is a lot faster than the memory mapped interface used
on 68000 boards (like T36).
I would choose the PAK again, IMHO it is a good and stable design, and
everything is documented (you get the GAL sourcecode), so better support and
patches are possible without depending on the manufacturer.

From: "Craig. Graham" <Craig.Graham@ncl.ac.uk>
Message-ID: <3r6rr7$fv8@whitbeck.ncl.ac.uk>
Source record: 25744

I've almost finished writing an FTP Client for GEM now, but I've come up
against one problem that I can't seem to solve.

ASCII mode transfers (such as file listings) work ok, but when doing
binary mode transfers (send a 'TYPE I' command over the control socket
before sending the 'RETR <filename>' command) the stream on
the data socket replaces all LF characters with CRLF ($0A becomes $0D0A).
I've tried eveything I can think of to stop this, and have had no success
- any suggestions welcomed.

Having done a binary diff on a couple of files (transferred using
my FTP & BSD ftp) this is the only differance between the two...so
I must be almost there.

Anyway, I've kludged it for now by post-processing the read buffer before
writing it back out to a local file, but there must be a way to stop
this from happening.

This is directed particularly at Kay Roemer if he's listening (I've
lost his email address).

Craig.

G'day fellow Atarian's, need some info !!
H.P. have just released there 'Office Jet LX' (I.D. code C2891A)here in West Australia. This is a Fax, Scanner, Printer and copier all-in-one... IMHO H.P. make some VERY good equipment and I think this machine is a winner...

However H.P. seem to cater the 'clone' market and supply software for PC's only...

Here's the QUESTION:(at long last) Is there any software out there, which lets ATARI ST/Falcons use all the features of this H.P. Office jet i.e. the scanner side of it... (I'm sure the printer part will work)

Thanks in advance, regards

Did you ever get a local ftpd to work? If you had you might have tried editing
that so you could see exactly what BSD ftp and yours were sending.

The only other thought I had is that IIRC you can open a socket in ascii or
binary mode, if opened in ascii mode it does the same translation as the stdio
library's ascii mode, ie LF->CRLF. Are you using binary mode sockets?

yes, that is a known problem. There is a fix called "falcon clock patch"
which requires soldering inside your falcon. There are a variety of patches
available. I have one installed inside my own falcon. Do you know the
board revision of yours?

Try and get a good terminal program! There are a lot of them available which
make use of any serial port of the falcon. I will only mention 3:
Rufus
StarCall
CoNnect
All are shareware. If you want higher baudrates on your modem2/serial2 ports
you should consider getting also either Fast(X)Serial or HSMODEM.

Greetings,
Thomas

This is almost too simple, but it may have been overlooked. Are you remembering
to open the files in binary mode? "rb" and "wb" (for the mode param)

Howdy all,

I would like to know if anyone out there is using a Printer Switcher
(active or manual) with both your printer and Steinberg's SMP-II.
What kind of a model can be used, and do all models work with SMP-II
(heavy bidirectional traffic)?

Best Regards,

|> Did you ever get a local ftpd to work? If you had you might have tried editing
|> that so you could see exactly what BSD ftp and yours were sending.

Well, sort of. My local ftpd now connects & logs in correctly, and responds
to the initial LIST command, so I get a directory listing up. However,
it now kicks me out whenever I try to CWD, XCWD, RETR - of even do another
LIST. Also, logging in as anything but root drops you into a sort of limbo
directory with nothing in it, and no where to go from it.

This isn't a problem with my client, as the BSD client suffers from the same
problem, and my client now works fine with other servers (ie. not the MiNT
one).

|> The only other thought I had is that IIRC you can open a socket in ascii or
|> binary mode, if opened in ascii mode it does the same translation as the stdio
|> library's ascii mode, ie LF->CRLF. Are you using binary mode sockets?

I've finally sorted out the LF->CRLF problem. For some reason, the initialisation
code I poached from BSD's ftp client (which worked fine compiled with GCC)
just failled to cut the mustard under Lattice. So I bit the bullet & wrote
my own (admittedly much simpler (ie. no restarts)) code to do the same thing.

Also, a bit of help from Stephane Boisson on re-opening sockets as files
has solved part of the problem as well.

Practical upshot - binary transfers now work ok, and I've just mailled out
the initial beta release, a full release will be when I've tidied up
the GUI a bit (put in support for mono machines & machines with no CICON's
in the AES).

Craig.

2442. partition (MS-DOS) problem

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-09 00:00:00 UTC
From: kim@dksoft.ping.dk
Message-ID: <FFJABHWVUP@dksoft.ping.dk>
Source record: 25761

Hi there..
I'm in a strange situation here. I need to connect a MS-DOS formatted
harddrive to my system using ADSCSI+ and ICDBOOT 6.5.1.
In the ICD manual it says the MS-DOS partitions can be read/written,
and only 'very large' partitions could become a problem.

Now my problem is, my system can't recongnize partitons made on the
MS-DOS which is above 66Mb in size. And to me, that is far from beeing
a 'very large' partition. If thats what ICD meant with large partitions,
then it's time they wake up and smell a real harddrive. The drive
i'm having right now is a 1.8Gigabyte. And as you probably can see, if
the limit is 66Mb, then this drive is no good to me, as it would bring
me up around 30 patitions, which the TOS no doubt can't handle 8-)

So my question is. Does anyone know the exact limit on a MS-DOS partition
for the ICDBOOT driver. Or is there another alternative ? (Don't say
SCSITOOLS. This driver simply through away 800Mb, because this drive is
larger than 1Gigabyte. I wouldn't even partiton more than 1024Mb).

It's time the Atari community starts waking up.. Soon we'll all be having
very large harddrives.

Greets
Kim

Ps, if anyoen want to know why i need this large drive, don't ask. It's
just for testing 8-)

Could be a problem with a desk accessory. If you didn't disable them
as well, you may want to do that too.

Also, you could have a corrupted NEWDESK.INF file. Try renaming your
current one to something like NEWDESK.INX, then save the desktop to
create a new one.

Good luck!

A real problem, but the only way is to upgrade any ST with STESCC from Harun
Scheuzow from Germany. This little Hardware expands STs with 2 extra serial
hispeed ports. 115kbaud are no problem, it uses the SCC as Falcon and TT.

>No problem there at all..! I wish everyone I knew here in the US spoke...

Thank yoou :)

From: Jake@aardnet.demon.co.uk
Message-ID: <3rf7ud$sk1@imp.demon.co.uk>
Source record: 25773

Well, it's like this:
This friend of a friend said his ST was unwell, and I graciously (foolishly?) offered to have a look at it for him. I thought it might make a nice trip down memory lane - I traded mine for a PC (pressures of work, honest!) some 3 years back, and haven't taken one apart since.

Anyway. It arrived, and on switching on, does what it says up there on the subject line (not sure of the spelling, though). This is not good. While I never had any problems fixing mine and various friends' assorted computers in the past, switchers have always been a _total_ mystery.

Anyone out there got any hints for me?
Failing that, where (in the North of England) might I replace (Part-ex?) it?

Symptoms are:
- aforementioned sound effect, but I'm not sure where from and didn't fancy poking around to find out (I'm allergic to 300V heatsinks)
- fuse intact
- no visible faults on the component side
- Very singed PCB in the vicinity of the big yellow tranny in the middle and the two high (ish) wattage resistors next to it.

Hi, I am trying to get in touch with 'Hard & Soft' of Germany, who manufacture the TopLink host adaptor.

I need to know what I must do to get their TopLink to work with an IBM 0661-371 SCSI drive. This drive has no onboard termination and cannot provide terminator power, two things that the TopLink requires ! (apparently). Essentially, will it work if I put an active terminator on the SCSI bus ?

I have been given their mail address & phone number, but I can't speak German, and whilst I am sure they speak perfect english, the idea of calling international to ask a possibly complicated question scares the hell out of my phone bill !! :-)

Anyone living nearby want to call them for me ?....or know an e-mail address for them ???

MANY thanks in advance,

Cheers,

Kev.

Excuse me ??
I guess you just missed the point in my message. I needed a large MS-DOS
partiton on my Atari.

>Reformat the drive with the latest ICD software, (6.5.5.)....

Think Roger, think! No need to reformat. The format is the same. It's the
partition, (file struckture ect.) which is a problem.

And btw. I can't get 6.5.5 to work. It freze my machine all the time.

Greets
Kim

2465. 2 drives, 1 cable. It can (almost) be done

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-12 00:00:00 UTC
From: buxmjp@zippy.dct.ac.uk
Message-ID: <1995Jun12.114634.17857@zippy.dct.ac.uk>
Source record: 25784

After much dead ribbon cable, I can get 2 floppies running off one ribbon cable in my MSTE. Due to ataris wisdom once more, the standard PC cable with a twist in doesn't work, and neither does a straight cable. Instead, you have to take cable 16 (and 15 if you want) to pin 16 (and 15, all odd numbers are ground) on both drives. Conducters 10 and 11 are used to control drive A: Connect them to 10 and 11 on one connector, and set that drive ID to its lowest value. Pins 12 (and 13) are used to select drive B: Either connect them to 10 and 11 on the other connector and jumper it as drive 0, or to pins 12 and 13 and jumper the drive as 1 (assuming its ID is from 0-3)

However there is one problem with this. When B: opens a file and trys to read it in sections (eg viewing a long file from desktop) I get file read errors on some files. I know it isn't the drive, and I'm pretty sure my cable isn't at fault (after all A: works fine) This only happens on some files. It doesn;t have any problems reading the file as one block, or writing to the drive. PLease mail any ideas/solutions to me and I'll post a summary.

If I can get this working, it will make my recase a lot prettier. This file is ribboncable-ware. If you like it, feel morally obliged to send me a metre of 34 way ;)

: larger than 1Gigabyte. I wouldn't even partiton more than 1024Mb).

: It's time the Atari community starts waking up.. Soon we'll all be having
: _very_ large harddrives.

First of all, you can have quite large Atari partitions, and we've
had them since 1989, so we don't really need to wake up. Second,
MS-DOS partitions are different, and there are some GEMDOS limitations
to what can be done by the hard disk driver. It's not the driver's
fault if you cannot access DOS partitions exceeding a certain size.
Unfortunately, the only operating system for the Atari which still
evolves is MagiC, so we have to wait for a solution from there.

2472. problem/question re GCR and mac roms

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-12 00:00:00 UTC
From: nicole@seas.smu.edu
Message-ID: <3ri46s$3pk@giant.seas.smu.edu>
Source record: 25791

I hope someone here may have some insight into a problem I'm having with my spectre gcr and mac roms.

I get the roms not seated/not present/in backwards screen too often when I run Spectre 3.0. It happens most often when the ST's been on for a while, seldom when I just turn on the ST and go straight to spectre. Once I get to the mac icon, I never seem to have any problem; it runs fine until I shutdown. I only seem to have trouble with the screen that forces me to reboot the st and re-run spectre.

After suspecting the cartridge port (resoldered pins to board and cleaned and adjusted contacts) mac roms (cleaned and reseated), I'm pretty sure the problem is temperature related with the roms. When I have the problem, a quick spritz of freezit makes the second attempt go smoothly.

The roms in the cartridge (which I bought used, cat and roms together) don't seem to be apple. The say ST 88847 M2751241.

Should I just seek out new roms, or is there some other possibility, such as the 3.5v 10mfd cap that's on the cartridge board not up to snuff and making the roms run hot?

Thanks for any suggestions including where to go for new mac roms.

|

All ST's have MIDI ports.

Installing a hard drive *in* an ST is difficult but not impossible.
Hard&Soft of Germany will sell you a little piggyback board which
provides an internal IDE interface and also updates the OS ROMs --
hard disc access with older versions of the OS is slow, slow, s l o w.
(Hint: get the English-speaking version of the ROMs :>)

Fitting an external hard drive is easier, but you need either a SCSI
drive plus an adaptor (such as The Link from ICD) or a special ST drive
which has the adaptor built in. You may be able to buy one from a
fellow musician who is upgrading or getting married, complete with
sequencing software (preferably legal).

BTW you won't get much sequencing done in an unexpanded 520. Even a
1Meg machine is a bit tight for most of the mainline sequencers. (But
Henry Cosh's shareware program will be usable). Note that some memory
extensions for 520s are a bit dicky mechanically speaking, so if this
machine is going on the road with you then you should be looking for
an STe, which can be upgraded to 4M using standard SIMMs.

| is anyone out there in nz with a suitable system for sale??
|

Sorry, but to get your hands on my STe, MegaST, Falcon or ATW you'd
need to travel to the far side of the world *and* bring your own army ...

Well, this problem is due to the form_button-function (I guess you use it) which doesn't respect any clipping rectangles. If you want your windowed dialogs to be operated in the background, you'll either need to write your own form_button-routine or handle selections in the background completely yourself.

Ciao

Thomas

I've had the same problem. It was my inetd that caused the trouble. For some
reason inetd didn't start the servers (ftpd, telnetd, etc) in the first
10 minutes after booting.
Starting up your inetd with a higher priority (negative nice level) will
help.

2486. PROG_DEF & WF_BEVENT problem

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-13 00:00:00 UTC
From: ee11cd@surrey.ac.uk
Message-ID: <3rin3u$a23@info-server.surrey.ac.uk>
Source record: 25805

Hi,

I have a problem using WF_BEVENT and my PROG_DEF objects.

I've set my windowed dialogues to respond to background object selection (i.e. objects can be selected without topping the window) by using wind_set() with the WF_BEVENT parameter.

In some of these windows I've implemented PROG_DEF objects (such as radio buttons), and I use my own VDI workstation.

The problem is that if I select a PROG_DEF object in a background window, when GEM redraws the object (as SELECTED or DESELCTED) it overwrites onto the top of any overlapping window.

In my PROG_DEF handler I do set the VDI clipping rectangle. Everything worked perfectly until I added background object selection.

If I use my window library's equivalent of objc_draw() to redraw the objects then everything id OK - no overwritting occurs. This only happens when the object changes state & GEM initiates the redraw!

For my windowed dialogues I'm using a modified version of FLDLIB - however I haven't changed the redraw function.

If you know how to resolve this, please contact me via email at

ee11cd@surrey.ac.uk

Thanks!!!!!

Craig.

(p.s. I'm using LatticeC 5.60, on a TOS 4.04 Falcon)

2487. What is the exact frequency of timer A in the ST ?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-13 00:00:00 UTC
From: system@korg.enet.dec.com
Message-ID: <3rj871$q1@jac.zko.dec.com>
Source record: 25806

Hi,
I am trying to figure out what the exect frequency of timer
A is in the ST. I can't seem to find this information in any
book.

I understand how to control the prescale, and countdown value,
but I can't seem to figure out the frequency of each tick.

Some rough experimenting seems to lead to roughly 2.4 MHZ...

PLEASE post the answer if you know it!

Thanks...

The eagle is based around an '040@32/64 and the medusa can be had with either
an '040 or an '060. By the way; you can change the processor board in an eagle
(there will be ppc boards for it).

Does this mean you want to swap the drive between a PC and ST often or do
you just want to use it with an ST?

If you want to keep swapping it around, the maximum partition size that is
compatible with both systems is 32 MB.

If you just want to use it on an ST then reformat it.

>Now my problem is, my system can't recongnize partitons made on the

You should be able to use ICD to partition this into much larger sizes,
but only if it is formatted for the Atari.

Well, almost correct... it's 2.4576 MHz and I got this info out of the
Atari Profibuch (ST/STE/TT, it's in German), you'd better look out for the
Atari Compendium as it seems to be the ultimate Atari manual.

=0D=0CHi to any experts out there.

I have an STe with a Gastiener GE-Soft host adaptor
+ GE-Soft driver software.

Can I use the ICD professional hard drive utility software
with this setup?, or will I need to switch to the
ICD link adaptor?
What does the ICD s/w provide?

If I switch to the ICD Link2 will I need to reformat
my drive, or will the disk still be readable
using the ICD driver software

Any help would be gratefully accepted.

PS. if possible could you E-Mail me directly as I have
no direct usenet access..

You could try Bash, while still being quite large, it is compiled with
gcc -mbaserel, so that only one copy of the text segment is resident
all the time, regardless how many times it is running. You can use it
as /bin/sh as well (by making a symbolic link /bin/sh -> /bin/bash).

I think so. Some time ago, I've thought about writing some kind of
conversion routine and implementing it in a disk driver. It could probably
be done, but it would be mucho nicer if the OS just supported large
clusters.

>partition, (file struckture ect.) which is a problem.

MSDOS Uses biger clusters, GEMDOS does not support biger clusters,
but can support biger logical sectors..

>And btw. I can't get 6.5.5 to work. It freze my machine all the time.

Are you using the the Utils program to install it, just copying
the icdboot.prg and renaming in it to ICDBOOT.SYS does not allways work,
as they some times change to boot software in sector 0/1..

Allways install new ICD software via the Utils program....

First make disk A a Autoload one, with the new booter in the Auto folder,
also use DC format to make this disk (A) bypass the hard drive, this makes it
very simple to install...

Another trick is to run the guest program to mount the ZIP drive, run the iomegatools program to write-protect the 100M install diskette. This idea came from Mr. Lee Busky whom I bought a used ZIP drive and diskette from. When I received the drive and install disk, I can install the ZIP on both MAC and PC without troubles. :)

NO! This won't work, AFAIK. At least from the Mac side, the Zip Tools disk
appears as a write-protected, PASSWORDED 50 MB cart. The install process
removes the password along with the write-protection & the other
partition. Here's how I did it:

Used guest to mount the Zip Tools original.
Used Disk-to-Disk copy to make a Zip Tools COPY on a blank Zip cart.
Installed off the COPY.

I have no idea if the D-t-D copy kept the DOS information, but it doesn't
matter since my original is still intact.

FWIW,
Tim

Hi,
I've just received a 210 Meg Hard disk for my Atari ST (520
STFM upgraded to 1Meg). It uses an ICD Host adaptor, and the software
allows *big* partitions (known as BGM partitions).

My problem: The guy I bought it off used it with an STe, and
partitioned the drive with >16Meg GEM partitions. My STFM doesn't like
this!

My question is: Is it possible to re-partition the drive (using the
ICDFMT program) using the same partition sizes (but with BGM partitions
rather than GEM) WITHOUT LOSING THE DATA ON THE DRIVE
****

(I have access to an STe - thats how I know about the partitioning)

I suppose the alternative would be to get TOS1.4....

I would be interested to hear any responses (by e-mail preferably)

Thanks!

john..

Following my previous message....

When I turn on my STFM, with the hard drive connected and powered up, the screen goes haywire! COnnecting the same drive to an STe causes no problems. The drive is partitioned into 10 parts, ranging from 10meg to 28 meg in size. The host adaptor is an ICD AdSCSI-plus, dating from 1990 - so it should work....

What do I do?!

Thanks

john..

Well, if the computer still goes, it's probably the power switch arcing. We have seen this on a number of occasions. Just replace the switch, or try cleaning it out with Isopropyl Alcohol.

If the computer doesn't work any more, then you probably have to repair or replace the power supply, a simple procedure. We've seen many power supplies being fixed. Not a problem! If you're not sure, just put in a power supply from another ST. This is always the simplest way to diagnose - swap and change.

Hope this helps.

>| I'd like to write a veeery simple (believe me, veeery simple...)
>| text editor in gfa-basic,

>Don't. Please.

Ignore him, he doesn't know what he's talking about. I wrote Oasis_ed in
GFA and after compilation it's faster than Everest or Tempus in all file
handling aspects It can insert a 200K text file in the middle of another file in
under 3 seconds, and delete 6000 lines from it in under 2 seconds. Also it is
fully Gem with windows,configurable menus, dialogs and mouse control. The only
concession required for GFA is that memory is allocated to a text file in the
form of number of lines by one command DIM line$(max_lines).

Have a look at it you can get it at ftp.demon.co.uk in directory
/pub/atari/oasis.

If you need any help email me directly as these C purists are blind to
any other language. They always seem to forget that the quality of a program
isn't in the language it's in the programmer.

But for first thoughts, think about using a dimensioned array of strings
and use one per line then all you need to know is the offset in line numbers
from the top of the text file and the cursor position to work out which string
and character to edit. This may seem over the top but it will allow for simple
handling and each line can be any length upto 32000 characters and the memory
handling, garbage collection etc will be handled by GFA. You can forget about
disk handling as GFA will do this for you with RECALL & STORE better, quicker &
simpler than C.

If ICD thinks 32Mb is a large partition, i should say they're way behind
reality. I got a note from ICD telling me this was written back in 1990.

>MS-DOS partitions are different, and there are some GEMDOS limitations
>to what can be done by the hard disk driver. It's not the driver's

Yep, that has been told to me last night. I wasn't aware about the GEMDOS
limit.I thought it was a matter of getting the right driver.

You should at least have 8 MB of RAM. In case you're using system
7.5 you need even more. I have 12 MB in my Performa and usually
about 8 MB free under MagiCMac (but you could have more, without
extensions and auto-folder programs). Your HD is fine, but this
all depends on how much space you need for your applications.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ok.
I have a 210Meg hard drive hanging off of an ICD AdSCSI plus host
adaptor. When I connect this to an STe, it works perfectly. However, when
I connect it to an STFM or MEGA ST, the monitor display goes completely
haywire. The problem remains even if I disconnect the hard drive from the
host adaptor.

I think that it's either:

a) a problem with the host adaptor, or
b) a problem with the ST (FM or MEGA) DMA output port.

I shouldn't think that it's a) because it works with the STe.

Has anyone had any similar experiences?

I'd be extremely grateful for any replies.

>I can use?
>
>THeo
Check the docs with the tcsh you have - the one I use is 6.0.3 (can't remember
where I got it) but the docs mentions it was compiled with -mbaserel and
-mpcrel and the program sharing flag is set so it uses significantly less
memory for each copy of the the shell running. (ie the _text segment
is shared among all copies running) so you second copy does not
actually take 300K (although ps reports it does)

Speaking of which, is there a way to dtermine exactly how much memory each
extra copy is taking?

Nope, sorry, you can't. Your best bet is to back the sucker up with your friend's STe and use your STFM to repartition it. You see, the partition for TOS 1.4+ still uses 512 byte sectors and 2 sector file allocation units (if it is less than 32 megs).

: **********

: (I have access to an STe - thats how I know about the partitioning)

: I suppose the alternative would be to get TOS1.4....

Good idea, better yet, get TOS 2.06.

The 68901's timers run from a 2457600 Hz crystal. This info is from the circuit diagram at the back on "The Concise Atari ST 68000 Programmer's Reference Guide", and is also mentioned in the "Info on the MFP" file on the "ST Assembler" World Wide Web page (where you'll find lots of other useful stuff, too):

2525. Vortex HD Troubles

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-15 00:00:00 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <3rpi6k$n9q@dux.dundee.ac.uk>
Source record: 25696

I recently attempted to set up a vortex HD 40 plus on a 1040STE. However
it totally fails to ott when you switch the machine on, it basically
just goes into and endless re-boot.

At present it has 4 paritions, C,D,E,F, with the AUTO folder on C containing
the VHDPLUS.PRG (driver) in the root directory are all the files from
the HD plus set up disk. I tried to set the thing up to auto boot using the
appropriate program. But it doesn't work.

I know all the files are on the HD as it is possible with LOTS on hassle
to get it to boot from floppy, and all the files are there. Does
anyone know what the problem is?

If I recall correctly, the fix is adding a small capacitor to the reset line. I'll try to find the right up on it that was posted to this group a long time ago.

2529. [Q] Freedom Demo loses keypresses

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-15 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <3rntul$7ju@status.gen.nz>
Source record: 25700

I have just recieved the Demoversion of Freedom. It is the German version 1.10 06/02/95.

I have put FFSEL.PRG in the AUTO folder, and have got my GEM.CNF RUNning FREEDOM.APP (so it is always resident.)

When I use a keyboard shortcut (eg. ALT-x to change drives) the drive changes, but the keypress gets passed on to Gemini, causing various dialogues to appear, which is most annoying. Also, I cannot type simple text into any editable fields in freedom, it simply does not respond. None of the fields seem to have a cursor in them.

What is the current version, and where can I get it from (preferrably and English version.)

I use MiNT 1.12 with AES 3.0 (MultiTOS). I use Gemini 1.999e, as well as as Tabby, XControl, TT Artist. In the autofolder there is: ffsel.prg, mintnp.prg, mouse3.prg (ms serial mouse driver), nvdi.prg (v3), tabby.prg and xboot.prg (2.5 or so.) I use a TT030 with 220meg HDD, 4meg STRAM 4 meg TTRAM.

Thanksyou for any help, it is very much appreciated.

They all do :-)

> and can a mono system with just say 1-2meg run a midi sequencer??

Yep - AFAIK

> Can harddrives be installed in the 520/1040 and what type?

They need to be external hard drives - but otherwise yes. SCSI is the
favourite - and they are controlled via a SCSI host adaptor suitable for
the Atari. It helps to have SCSI drives where the parity can be turned off
- as this increases the number of models of host adpator which work.

:-)

2531. Programming a MIDI thru

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-15 00:00:00 UTC
From: mud08@cc.keele.ac.uk
Message-ID: <3ro8ff$h2d@gabriel.keele.ac.uk>
Source record: 25702

Does anyone know how to write an interrupt driven MIDI through routine in C (or a machine code module). I would like a transparent MIDI through on a program I am writing. It's GEM, and currently I'm escaping from the evnt_multi loop by using a 0 timer value and testing the MIDI port each time. As expected, this is not a brilliant way of doing it, as it tends to slow GEM down and can be unreliable. The only way I can think of doing this is by using interrupts, but I have no idea of how to implement it, or even if this is the best way to tackle the problem.

Absolutely any suggestions on this will be welcome,

Cheers,

Richard

The current version AFAIK is 1.13, you can get it from
ftp.cs.tu-berlin.de in /pub/atari/Utils/Disk/frdm113e.zip

>I use MiNT 1.12 with AES 3.0 (MultiTOS). I use Gemini 1.999e, as well as

You should get a new version of Gemini also! Current is 1.a, available also
from ftp.cs... in /pub/atari/Utils/Shell/gmni1a.tos

Nope, cause you'll change the FAT structure, and because of this it would
be impossible to read something from your partitions, WITHOUT making
an lowlevel format first. When doing a lowlevel format, all data will
be removed..

>
>(I have access to an STe - thats how I know about the partitioning)

Do a backup then.

I have seen (at least I think I did) the ZIP Mac disk and the ZIPTools on Compuserve in the Iomega part (Mac Vendors C, if memory serves me). Since I do not yet have a ZIP (they should be arriving here in the Netherlands any day now) I didn't see the point in downloading the files.

: the 32MB partition space (for the ST series at least, not sure about the
: STE or beyond).

Oh well, we are getting into that drift again 8-)

TOS and MSDOS have different internal limits on parameters such as
sector size, cluster size, numbers of sectors in a cluster et cetera.
To drive partitions larger than 32 MB, they implement different
strategies which are each within the original Microsoft specifications
for partitions, but work around different gotchas in the operating
systems. In TOS, for example, you can have large sectors, but you
cannot have more than 2 sectors per cluster without risk for your
data. In MSDOS, it's safer to drive up the number of sectors per
cluster, so that's what they do if my memory serves me right.

So while both methods are perfectly OK with respect to the
documented guidelines for FAT filesystems, each method has its
individual problems on the "other" platform, so you cannot have
TOS and MSDOS drive the same "large" partition (and I agree with
Kim that 32 MB isn't really large these days) without problems.

To cut it short: TOS works around its own bugs and breaks MSDOS,
and MSDOS does the same breaking TOS. Both operating systems have
their conventions for large partitions. As a matter of fact, even
TOS 1.0 can drive a partition of up to 256 MB, so you don't
need TOS 1.04 to do that. (Well, you wouldn't want to work with
TOS 1.0 on such a large partition since it is so slow...) TOS 1.04
was said to have a lot of bug fixes in the filesystem code which
make even larger partitions possible (512 MB), but Juergen Lock
and I found out and proved that even TOS 1.04 still has a dangerous bug
which can wreck your data if you work with such a large partition.
There's a workaround for this bug, however, which can be applied
by the partitioning software. If your partitioning software is
smart and aware of the bug, you can actually have partitions
of 512 MB with TOS 1.04. Later TOS versions may support even larger
partitions, but I haven't followed their individual bug/limit
situation that closely.

Not only will you not be able to repartition it without losing any files, you have to do a new format and then partition it your own way. Maybe you can ask him to copy the files onto floppy and then you won't lose the files.

1. TOS 1.62 has 256kB beginning at $e00000,
but TOS 1.4/1.2/1.0 has only 192kB beginning at $fc0000

2. TOS 1.62 contains additional code to intialize the
special STE-hardware (DMA-sound etc.)

TOS 1.62 will never work on a STFM :(sorry.

Ciao...

I have:
an Atari 520STFM,
an ICD AdSCSI plus host adaptor,
a Rodime 210Meg SCSI HD

Can anyone tell me why, when I connect these together, my ST crashes,
with a mangled screen display? It's not the HD, since the problem remains
when I disconnect the drive from the adaptor.

The drive+adaptor works fine with an STe (i.e. it dosn't crash the computer).

I'm pretty desparate to find the solution to this problem,

thanks,

john..

>
>Now my problem is, my system can't recongnize partitons made on the
>MS-DOS which is above 66Mb in size. And to me, that is far from beeing

I thought the maximum partition size was 32Mb (64Mb >=TOS 1.4)
for NORMAL GEM (MS-DOS) partitons. the only way to extend it is via
BGM partitions which can be at least 64Mb -> 500 Mb+ Unfortunatly
you would have to reformat the drive on the Atari to use BGM...
TOS can only handle 14 partitions although ICD have a desktop.prg
for hiding partitions ;-)

5 years ago 65mb was a fairly large hard disk, now I run my home system
with 540 Mb HD and it's still just as cramped for space :-((

Do NOT under any circumstance trust the Test archive in lharc 3.10!
I trusted it until it reported that a file which was obviously truncated
(the test indicator stopped at 60%) was fine. A bit later it reported that
another file (where the indicator did, in fact reach 100%) was OK, too.
On extract the file reported a CRC error, and in fact the last 75% of the file
was trash.

So watch out! If you want to be sure your LZH file is OK, you have to extract
it, at least with 3.10 version.

That's probably cos you've got the driver in the AUTO folder!

Do you ever take any notice when people answer your questions? You popped
up with this one on CIX several days ago, and several people responded with
help. (Including advice to remove the driver from the AUTO folder).

2548. MiNT 1.12 - Help Needed

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-16 00:00:00 UTC
From: ali@birnie.demon.co.uk
Message-ID: <803311012snz@birnie.demon.co.uk>
Source record: 25717

I can't get MINT 1.12 to accept any entry in the INIT= field in mint.cnf unless the program is in in C: or C:/MINT. If I try to run INIT or MGR or TCSH or whathaveyou from the M drive where my minix partition lives, MINT comes back with "FATAL - could not run xxxx -leaving MINT", and exits with error code -33, sometimes -34. I also tried MH-MINT, level 1.12.4 and it does the same thing. MINT 0.95 works fine but of course doesn't load the MiNTNET drivers.

If I try running MGR from C: (by INIT=) or from the desktop or from a shell it comes back with "Can't find mouse, or mouse is in use : file not found". I just _know_ i'm doing something bloody daft but this problem is perplexing me and i'm xxxx'd if i can figure out how to get round it. HELP, someone, I'm cracking up!

Regards.

I just cracked it!! It was Minix!. I have just installed the latest
version (0.6 PL 11) and all is well.

Still no luck with MGR, though, so I'm still not out of the mire.

2552. IDE interface for ST/F/M

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-16 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <3rsu6p$gvo@hasle.oslonett.no>
Source record: 25721

I have a PCB and a pre-programmed GAL chip for the IDE hard disk project featured in the German computer magazine C't which I want to sell.

I was hoping that I could use it with my STe and add an internal (2.5") IDE type hard disk which would save me a lot of money compared to an external SCSI unit which I would need a case/power supply and a DMA/SCSI converter board or cable for.
Well, apart from the problem of the physical difference in shape of the 68000 processor, I got verified from two major German companies producing these kind of circuits that it's just not possible to use IDE hard disks with STe machines.

They do however work with the standard ST/STF/STFM machines.
The circuit is pretty simple, and apart from the PCB and GAL there are only a couple of cheap components, but you will need TOS 2.06 which will be installable on this PCB (i.e. you only need to buy the two ROM chips and not a "TOS switcher" or similar).

I will sell the PCB and GAL chip for the same price as I bought it for, which is 45DM (German Marks) in my currency or something which we can work out.

Please email me if you're interested.
And as I can't go through with my initial idea I'm looking for a second hand SCSI drive (external). Anyone got one for sale or know someone with a Mac or something who needs to get rid of a harddisk? I can do with a small one for now, although I'd like a 300-500MB if I could get it cheap enough.

From: nnoiseux@tiac.net
Message-ID: <nnoiseux.112.000C6F60@tiac.net>
Source record: 25723

i would like to know how the stacy's lcd screen was interfaced to the
st core of the stacy.....
i could imagine 2 ways...
1 - the stacy lcd is interfaced to the standard st monochrome output through
some kind of interface logic,
2 - the lcd has it's own proprietary interface logic and bios routines to the
st bus, possibly it's own address range.
can anyone enlighten me on this?
thanks!

T > I'm looking to buy a small atari-st system to use for midi
T > sequencing (wot an original reason to buy an atari!)....i want
T > to know a few things about the st, for instance what models
T > have midi ports built in? (does the 520?) and can a mono
T > system with just say 1-2meg run a midi sequencer?? Can
T > harddrives be installed in the 520/1040 and what type?

All ST models, the TT and the Falcon have the MIDI ports.

Most sequencing packages like Cubase and Notator SL will run
quite happily in one megabyte of memory; Logic is the only one that
I am aware of that requires two megabytes to run (although its
editing and enviroment features are well worth it!). However, if
your compositions are fairly long or uses tons of MIDI events like
pitch bend (like if you're using a guitar synth to enter melodies
like I do), it's better to make sure you have plenty of memory - I
have four megabytes residing in my STe for that very reason.

If you mean can a hard drive be installed inside a 520/1040
case, no. But you can hook up an external SCSI-based hard drive to
your system utilizing an ACSI-to-SCSI host adaptor and the proper
driver software - I use ICD's the Link II, which is a host adaptor
the size of a dongle which just plugs into the 50-pin SCSI cable.
Currently I'm running a Conner 40-meg drive, an IBM 100-meg drive,
and (with the help of ExtenDOS, a driver from Canada) an NEC
internal CD-ROM drive inside a mini-tower case, and have Logic and
my MIDI editors residing on their own partition......

2557. TOPLINK & IBM DRIVES !

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-17 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <06171995.164028@empyr.dircon.co.uk>
Source record: 25726

Hi. If anyone is having trouble trying to connect a SCSI drive that cannot provide terminator power to a host adaptor that requires it, let me know.

I've just solved it with a TopLink H/A and an IBM 0661-371 SCSI-2 drive !

All you need to do is splice in +5v from the power supply (preferably via a diode & a 1A fuse) to the cable that connects to pin 26 of the drive (bang smack in the middle of the IDC connector, row furthest away from the central notch [i.e. bottom]), without breaking the wire (so it still connects both drive & H/A), and make sure the scsi bus is properly terminated with either the usual terminator resistor packs, or a centronics type 'plug in' terminator block.

After several months of trying to get these two things talking to each other, the above method finally solved it !

Cheers,

Kev.

2558. Atari SC1224 monitor into Mac 7100: possible?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-17 00:00:00 UTC
From: knob@prairienet.org
Message-ID: <knob-1706951534320001@ppp25.cu.soltec.com>
Source record: 25727

A friend has offered to sell me his Atari SC1224 monitor in the event that it would be possible to connect it to my Power Mac 7100. It sounds like a fiasco in the making, I must admit, but it might be worth a try. Unfortunately, I cannot find any specs for this monitor, and don't really know where to begin. The connector is a 13-pin DIN, and I don't really know whether the monitor is composite or RGB. If it's composite, I'll give up. The PMac is pretty forgiving as far as monitors go; I have it running an Apple Trinitron and a Packard Bell grayscale VGA simultaneously right now. I've got the VGA patched through a variable synchronizer into the high-density monitor port, and I would like to replace this monitor with the Atari. Any ideas? Am I doomed?

Yes, you are. The SC1224 takes the same horizontal and vertical scan
frequencies as standard TV, roughly 60Hz (NTSC) vertical, and 15KHz
horizontal. Your powermac puts out different and much higher scan rates
which would damage the SC1224 and render the image unusable. The monitor
is RGB with a connection for Red, Green, Blue, Vsync, Hsync, Sound, and
ground. The same signals VGA monitors have, but do not be deceived, the
VGA Hsync signals are at least twice the frequency. It is more like a
CGA monitor, but with analog inputs instead of digital.

The PowerMac 6100/7100/8100 all put out VGA style signals. An AV
PowerMac has a TV/Video output, but it is only S-Video and composite, not
RGB and would still not work with a SC1224.

Sorry...

Rich

Image Copy 3.5 or 4 will easily handle your changes. Although not
shareware - since you are requesting shareware I will assume you
are planning on registering but want to see a demo. There are
demos available of Image Copy on many BBS (check graphics nodes)
and the software is very reasonably priced from the ST Club stock.

2570. Why i need MSDOS partition

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-18 00:00:00 UTC
From: kim@dksoft.ping.dk
Message-ID: <FFSVCDUWUP@dksoft.ping.dk>
Source record: 25739

It seems like some people didn't understand my meaning when i wrote
about the MSDOS partition problem i was having, so now i would like to
tell you why i need it.

A friend of mine has a CDROM burner, and as you might already suspect,
i want to have all my data burned down to a CDROM. Unfortunatly this
CDROM burner is only connected to a PC. And since my data contain just
about 500Mb in size, i shall somehow transfer 500Mb of data to a
PC.
Thats why i thought formatting and partitionate a HD on a PC could
do the job. It still can do the job i need, i just have to use 32Mb
partitions only. 8(And then i just have a spare 1.8G Hd i could use 8)

If you know of any other solution, i open to all offers. Don't say
a serial link. My STE only got 38400 on the port, and it'll take
around 36 hours to do the transfer. So i'll rather make 15 partitions
insted.

I've been able to borrow a Crazy Dots II graphics card for my TT.
I am using NVDI 3.x on my 'normal' TT.
Does anyone know if a version of NVDI 3.x exists for ET4000 based graphics cards like the Crazy Dots II ?. There was/is an NVDI/ET4000 version of NVDI 2.54.
In the adds I see only references to a version for the Nova graphics cards.
Any more information is appreciated.

PC Emulator.....

Some time back I think I read about another PC emulator that had been placed
in the PD, so were can I get this from and is it on a FTP site...

One name I have been given was SOFTPC.ZIP and that it was on a BBS,
so is this the one..???

Thanks.............

I am running my TT with a Crazy Dots II and NVDI 3.02 ET4000.
So there at least one version must exist.

Source record: 25645

Hi,

My friend has acquired a Megafile 30 (don't laugh !), and he's trying to get it to run with ICD software. Running ICDFMT.PRG, it recognises an Adaptec controller as being attached, but his drive is not listed in the options for formatting. Anyone know the number of cyls / heads etc for him to enter the data manually ?

I have a newer version of the ICD software than he has (I think he has 5.0.8, or so he says, although I can't remember such a version), would a newer version help here ?

Cheers,

Kev.

> try using tos 1.62 on a STFM?

The answer is "it will not work for lack of certain hardware".

TOS 1.6 is the same as TOS 1.4, except that it is EXCLUSIVELY for the STE.

If you wish to upgrade your STFM, which presumably has TOS 1.2, go to TOS
1.4, or better yet, 2.06.

I don't know much about that PC Emulator, but there was one written a few years back called PC DITTO.

PC DITTO ran even on a 512K machine, but it made it run super slow. It is like comparing a XT to a Pentium for speed. The Atari is equal to the XT while the XT equals the Pentium. That is how slow it is. I read the docs to PCXformer and the author says that a 10:1 ratio is best. If you want to emulate a computer your host computer should be 10 times faster than the computer you are trying to emulate to get best results.

This query is for a work Mate:

He has a 520STFM with a single sided internal floppy

He has an external Double sided Drive.

I remember reading years ago about a fix to make the ST boot from the external drive...

Anyone, care to do my mate a favour and help him out with a bit of expert ST knowledge??

I know his pooters a bit old, but it's all his got.

Thank's in advance...

ANY TOS can handle partitions sizes up to 256 MByte, you don't need TOS 1.4
for this.

>CDROM burner is only connected to a PC. And since my data contain just
>about 500Mb in size, i shall somehow transfer 500Mb of data to a
>PC.

I could be out of date, but from what I have read thier are Big problems
with cutting CD's on PC clones...

You need Hard Drives that are fast and they must have transparent Head
recalibration, plus a CD cutter that is buffered can also help...

Data to the CD cutter must be continuous with out any breaks, some HD's stop
sending data when they do head recals...

This was in a PC mag that reviewed a few CD cutters, I still have the mag
around some ware....

PS!!! 155.198.1.40 is more reliable!!! - (uni-paderborn, GERMANY)

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having

to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available at your site. If you don't, ask your local system operator how to transfer files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

William Wong (wongck@ti.com) wrote:
: Hi there,

: I am writting a simple GEM text editor for one of my applications. Currently
: the editor can block whole complete lines easily. I would like to be able to
: do blocking of partial lines.

: Does anyone have any ideas on how to do this? I have pondered on this for
: several weeks now but still haven't come up with something useful.

Ever thought of using two integer variables? Simple, do exactly what you
are doing now for block marking and add a provision for the first and
last lines. The first variable would contain the index into the first
marked line of where the block starts. The second variable would mark
where the block ends on the last line. Any block move or deletion
routines would use those variables to remember exactly what the marked
block is.

Sounds simple to me...Rich

From: wongck@ti.com
Message-ID: <wongck.217.000D344D@ti.com>
Source record: 25657

Hi there,

I am writting a simple GEM text editor for one of my applications. Currently the editor can block whole complete lines easily. I would like to be able to do blocking of partial lines.

Does anyone have any ideas on how to do this? I have pondered on this for several weeks now but still haven't come up with something useful.

Regards
William

Depends on the drive in the Megafile 30; Atari used several brands
(Seagate, Microscribe...). The Megafile should have a label at the
back which indicates the type of drive; if not, you have to open it.
I remember that one of the drives had 4 heads while the other had 6.

: I remember reading years ago about a fix to make the ST boot from the
: external drive...

If you want to boot just once from the external drive, you can set
the BIOS variable bootdrv (the exact location escapes me, though)
to 1, then reset. This will boot your AUTO folder from drive B.
If you want the external drive to generally behave like drive A,
you will have to exchange the drive selection lines.

2591. NetBSD/Atari Falcon volunteers sought

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-20 00:00:00 UTC
From: leo@ahwau.ahold.nl
Message-ID: <DAH0HM.5Mp@ahwau.ahold.nl>
Source record: 25660

I am working on the NetBSD/Atari port. Currently it is only usable on
a TT030 model, but I like to see this expanded to the Falcon. The Falcon
port is nearly finished. The last thing to fix before it can be considered
'working' is the SCSI interface. The SCSI interface is nearly working, the
problem is that the guy who was testing it for me, is no longer able to.
I really like to finish this thing! As NetBSD/Atari currently does not
support ACSI devices, it is currently pretty useless on the Falcon :-(

Who am I looking for...
Someone who likes to have NetBSD running on his Atari Falcon and
wants to spend some time to get it running. As it currently isn't
possible to compile kernels on the Falcon, until at least something
is working, you will have to receive kernels from me and report on how
they are doing. As soon as the basics are working, you can finish it
(or I do, if you wish). It will be easier when you also have a TT, in
that case, the TT can be used to create the kernels. In the _very_
ideal case, you are living in Utrecht and we can finish the stuff using
your Falcon and my TT ;-)

Please respond by mail (leo@ahwau.ahold.nl), I don't think the responses
are interesting for this group.

Leo.

>
> Has anyone had any similar experiences?

Yes - an STFM didn't like a Gasteiner drive - it booted OK but the minute you started to stream the system fell over just like yours. Eventually gave up and got my cash back. A few months later I picked up a Protar disk dead cheap and it worked perfectly! When I had TOS 2.06 installed by System Solutions they managed to swap my Drive cable for one of theirs and it stopped working! A happy 30 minutes or so testing cables showed that only about 50% worked on my ST.

I suspect that problem is due to the DMA chip being borderline and is therefore very sensitive when it comes to timing - which is why some cables dont work (incorrect capacitance).

Best thing to do is find a friendly dealer who can let you try out a few cables, or failing that is willing to try fitting a new DMA chip on a f it doesn't cure the problem we wont charge you full price for it".

2598. Z-modem under MiNT?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-21 00:00:00 UTC
From: artoj@mits.mdata.fi
Message-ID: <3s9nrd$j86@prime.mdata.fi>
Source record: 25667

Hi,

Could it be possible to write a Z-modem that doesn't use much
CPU power under MiNT? Connect's steals about half of the
power, and I think it is a bit strange. A 14400 bps connect
gives ~1600 character per second, which is nothing to
Falcon's bus, but still it hogs very much CPU power.
On the PC and the Amiga they claim that their machines
hardly slow down with these speeds (on the Amiga at least).

So is it possible with MiNT? And is there this kind of Z-modem
for MiNT?

: >Or a drawing program that can save a picture as .IMG file.

You could use GEM-View. This convertamong every format imaginable, Or
Picswitch, though this is not as comprehensive as GEM-View.
As a for a drawing programme tha saves IMG, any decent programme should
do that. Try Artis3 (I think it's PD might be Shareware.) Or there are a
number of commercial ones: Artis4, Truepaint...

Hope that is of some help

Sync 5v active low into 3.3K
Audio 1v into 10K
Video 1v into 75ohm.

And, of course, there is the mono-detect line; active low 1K pull-up to 5v.

> text editor in gfa-basic, but I do not have a clue about how
> to do it, I know how to read and display text but not on
> how to edit it on screen in large blocks.....

This is just a guess, but I would think you'd set up an area of memory, and get the screen pointers to point to the area in which your cursor is supposed to be in. Then the user enters input under program control, and finaly you offer the user some method by which to save the text from that block of memory. Now depending on what extra features you want to add, that adds to the complexity.

Later...

Once again the claim that ZIP disks are 100MB unformatted. I have never seen a rating for unformatted capacity from IOMEGA. What I do see when I run a DOS CHKDSK on my ZIP drive is 100,431,872 bytes. That's 100 megabytes by most disk vendors' standard practice of using DECIMAL megabytes.

Hi there,

On this text blocking...

>Ever thought of using two integer variables? Simple, do exactly what you
>are doing now for block marking and add a provision for the first and
>last lines.

Right, this is what I did but.... I am having problems in highlighting the text and not how to mark the line. The problem is that the highlighting from the anchor, the transition of highlighting before and after that. Also the problem of knowing whether the character which the mouse is on is already highlighted or not. Currently, I have a piece of code that is huge just to do all this and it does work properly not to mention slow and memory intensive (it create a map of characters in the editor).

Regards
William

Hyperpaint 2 will load/save degas (normal/compressed 1,2 and 3),
IMG,NEO and ART. It will run in Low/Medium/High res and can use
GDOS or SpeedoGDOS. It was on an ST Format coverdisk but I'm not
sure if it's PD or not. Lots of people got it with their ST so
you could probably get it cheap second hand.

Whatt all that just to replace a 4 pole switch...

I use a Multisync with a 4 pole switch....

Loaded 75 ohms outputs are 1 volt peek, plus, negative sync....

Outputs don't go negative....

I'm pretty sure that the ZIP-disks are 120-Meg UNFORMATTED. On an IBM, they
format out to 100 metric-megs, and on the Amiga, they should format out
slightly larger...

From: michael grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DAM9zB.AJ8@ridgecrest.ca.us>
Source record: 25683

Hi
I have purchased TelevEyes/Pro by Digital Vision (remember Computer Eyes for the ST?) It is a video scan converter with genlock. I use it with Apex Media and get excellent results. You can input NTSC or Y/C and it will sync that signal with the RGB output of the Falcon (in VGA mode only!). It outputs NTSC or Y/C (I'm not sure if there is a PAL version). The output signal must be the same as the input source, ie, NTSC to NTSC ect...It does not use the Falcons external sync and can be used on Macs and PC's. U.S. cost is about $580.00. The unit has its own menu for adjustments and mode selection. BC Computers in California advertises a genlock for the Falcon but I have no details about it.

Hope that helped, Mike.

>German and I don't read/speak German.

I've used this tool and created 2 EPROMs for my 1040STE with MagiC!3.
It works fine :)

Some Hints: If you are using a 'normal' ST (1040ST, Mega ST etc.) you
should create 6 EPROMs (27256 - 32k) beginning at $FC0000. For a 1040STE or
a Mega STE you need 2 EPROMs (270100 - megabit) beginning at $E00000.

Feel free to ask, if you have any further questions.

Ciao...

From: geoffc@eve.adam.com.au
Message-ID: <3seqe2$7j4@eden.adam.com.au>
Source record: 25687

Hi all...

Has anyone had problems recieving news with Ka9q/Atarinos software?
I am getting a nntp conection to my news server, but after saying
it is retrieving news headers I get messages like:

500 line too long
error while getting NEWNEWS - line too long

I can solve the problem by deleting newsgroups from my nntp.dat
file until the problem goes away, but this means I can no longer
get this news groups, else the problem reappears. My list of
active news groups is slowly growing smaller, so you can see
that this is not the ideal solution.

Any one else had this problem?

And does anyone have any ideas or solutions?

I am using v1.42 of ka9q.

Thanks for any help you can give.

Regards,
Geoff

Maybe you have a large cache in your hd-driver or your minixfs driver. I also
ran out of memory when I tested chimera a while back, but didn't realise that
those caches might be the problem.

Regards, Christer.

[Article crossposted from comp.sys.atari.st]
[Author was grubby]
[Posted on 24 Jun 1995 11:46:25 -0400]

Can someone please e-mail me some FTP PIRATE WAREZ SITES
for the Atari ST? I know they are out there.

Yes, I realize someone will say this is what hurt the ST in the first place,
but now, at this point, I don't think it really matters.

If I could find a source for stuff for it again, I wouldn't think about
chucking it and getting an IBM. I love the Atari so much more, but face
it, what new games and stuff there are don't show up on shelves anywhere
in the U.S. for it.

I have a lot of great and rare stuff to trade for other, I won't be a
leech. Thanks very much.

2632. TCACHE SETTINGS WITH 4MB?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-24 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <06241995.065911@empyr.dircon.co.uk>
Source record: 25501

Hi, I have now finally upgraded my ST to 4Mb, and I'm running TCACHE63 in my auto folder. This cache is supposed to be the fastest around, but it is bloody complex to configure.

Can anyone recommend some settings for me to get the fastest disk performance please ?

My Auto folder currently has :

NVDI 2.5 (I have 3.01, but uninstalled it as it used to take too much memory, but I will now re-install it)
PINHEAD
SILKMOUSE
POOLFIX4
SELECTRIC
TCACHE63
XBOOT

(Obviously not in order of execution !)

My ACCS are only:

STGUIDE and XCONTROL

I normally run TERADESK 1.40 as the replacement desktop and my usage consists mostly of writing e-mail !

Does anyone know how to configure TCACHE to run fast ?

BTW, I'm running ICDPRO software on my 105Mb SCSI drive, with all ICD cacheing, TOS buffers and extra folders set to zero.

Thanks in advance,

Kev.

Source record: 25503
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have received the chimera disks from TAF and installed them.
The PPP connection seems to work fine (ping is fast and telnet
and ftp work). However when I try to run chimera after
connecting with pppd, I get an out of memory report.
This is extremely suprising, as I have 4 MB and nothing installed
except MiNT/X11/pppd. Has anyone else ran out of RAM in this
type of situation?

Perhaps this is related to my having a 80MB minix partition
instead of 10MB. Does the minix driver store drive information
in RAM?

Any help would be appreciated.

TS> (wot an original reason to buy an atari!)....i want to know a few
TS> things about the st,
TS> for instance what models have midi ports built in? (does the 520?)

All ST, TT, and Falcon models have the MIDI system on the motherboard and
supported in BIOS.

TS> and can a mono system with just say 1-2meg run a midi sequencer?? Can
TS> harddrives be installed in the 520/1040 and what type?

You'll want the hard drive in an external case - there's precious little room
inside a 520/1040ST. 1 meg should be adequate for most sequencers. Mono is
probably better than color for that purpose.

KW> cannot provide terminator power, two things that the TopLink requires
KW> ! (apparently). Essentially, will it work if I put an active
KW> terminator on the SCSI bus ?

Make up a short cable with the usual "termination power" lead pulled away from the hard drive end (49 leads connected instead of all 50). A friend of mine fried that drive trying to connect +5v on the termination power lead. Bring the loose lead to the +5v line on the back of the drive's power connector through a low-value resistor - this is simply for current limiting, the value isn't critical, but should be under 330 ohms. Plug the other end into the host adapter and you should get the needed power. Termination is probably non-critical; I have 3 hard drives connected and one CD-ROM, and often forget to remove or install terminating packs (I change them around at frequent intervals); no harm is done.

: Can anyone help me, I have just fitted a High Density floppy to my TT,

AFAIK you flip switch 7. The DIP switch is under the Hard Drive near the front of the computer. I have been told that the early Motherboards don't have the necessary AJAX chip for High Density, but that can be remedied (check with System Solutions (ssolutions@cix.compulink.co.uk) - they should know all there is to know. So just put in the HD Drive flip switch 7 and that should be all there is to it. (It was on my friends TT030)
BTW cheers to another TT030 Owner ;-)

HEY, wake up!! It's the Atari ST
we're talking about. Nobody CARES anymore!

To most people, it's a joke.

A reply like yours, instead of help or advice,
just makes me think that much more about throwing
it out and getting an IBM.

Is that really what you want? One less ST user?

Especially when there are NEWSGROUPS with names
like alt.binaries.warez.ibm that are
jam-packed and I wouldn't even have to ASK anybody.
Hmph.

Besides, I have BOUGHT my fair share of ST software
in my time, try and find it now, where I live.

From: Daniel Saltzman <dans@wing.net>
Message-ID: <3skham$cp@news1.WING.NET>
Source record: 25515

Help! I need to figure out how I can download files from the net on my Macintosh (I have a Powerbook and a Performa) and then transfer them over to my 1040STe. I have a 300 baud (if you can believe that) modem for the ST and no hard drive.
Is there a way to get the ST to read mac disks. My Macs can write to ms-dos and pro-dos formats. I formatted a disk on my Performa in the dos format and the ST recognized it and I was able to read a text file. So that gives me hope.
But I really want to get some games off the net and play them on my good old ST!
In case you're wondering, the only reason I am going this root is because I have a very fast modem for the Mac and a PPP account/software and Netscape. I have none of that for the ST.

Any help really would be appreciated. Thanks.
DS

How DARE you say that this doesn't "really matter". It sure as hell does! There are still many developers out there trying to earn a buck on this marketplace so if you go out and steal software all you're doing it hurting the marketplace even more. Grubby, you ought to be ashamed of yourself.

> If I could find a source for stuff for it again, I wouldn't think about
> chucking it and getting an IBM.

There are quite a few sources for software. Ever hear of Toad Computers? I've got in front of me a 54-page catalog from Toad that covers everything I could ever want for my Atari computers including software and hardware.

If you're going to steal, then drop your ST, PLEASE, and go purchase an IBM. But don't steal that software either.

> I love the Atari so much more, but face it, what new games and stuff
> there are don't show up on shelves anywhere in the U.S. for it.

If you don't have a Toad catalog, give them a call at 800-448-8623 or 410-544-6943. They'll be glad to send you one. And there are a lot of new products available. Instead of whining support those of us that are still in business by purchasing our new releases.

> I have a lot of great and rare stuff to trade for other, I won't be a
> leech. Thanks very much.

Thank YOU for not stealing software or making your legimately purchased software available for others to steal. It's wrong. If you are caught, you WILL be prosecuted. It's a guarantee!

2657. Piracy and the ST...and other stuff too

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-26 00:00:00 UTC
From: richwegner@aol.com
Message-ID: <3smobo$lv@newsbf02.news.aol.com>
Source record: 25526

Piracy for ANY computer hurts that particular computer. I used to be a pirate many years ago until I had one of my friends arrested and convicted of it. I immediately formatted ALL my disks that had that stuff on there and even reformatted my hard drive just to be safe. That was using the old Atari 800 computer and my first Atari 520ST. Now I have an Atari 1040STF (looking for a better one when I can afford it so I can have a whole slew of Atari's) and not one program on there is PIRATED. I heard that Apple Inc, will still prosecute if you have pirate Apple II software. I am going back to school for Software Engineering and I would like to make a living. PIRACY hurts. I hope to write programs for the Atari computers (hence why I want a slew of Atari's) in the PUBLIC DOMAIN and/or Shareware (maybe some commercial).

Now the other stuff...

Does ANYONE have any computer languages that will work on the Atari 1040STF? I have the stupid Atari ST BASIC and the even more stupid Atari ST LOGO (from the Language disk)? I am looking for C (and it's other ones), PASCAL, COBOL, etc...

Also, if I use a 14400 external modem on the Atari 1040STF with the regular serial port (non modified) can I get the full 14400 speed or will it go only 9600 online? I want to call BBS's from my ST instead of the IBM all the time.

Bye for now!

G > the Atari ST? I know they are out there. Yes, I realize
G > someone will say this is what hurt the ST in the first place,
G > but now, at this point, I don't think it really matters.

OH YES IT DOES!

Regardless of what you think, there are software companies that STILL support the Atari line - companies like Gribnif, DMC, EMagic, Steinberg, ABC Solutions, the company that does MagiC, Ease, NVDI, etc. And piracy at this point is going to be even MORE hurtful to them in the shrunken market. And I (and quite a few people here) would prefer to make sure we have the support and further development we need to make out machines viable - development that leeches like you would only destroy due to your own selfishness and disregard for others.

G > If I could find a source for stuff for it again, I wouldn't
G > think about chucking it and getting an IBM. I love the Atari
G > so much more, but face it, what new games and stuff there are
G > don't show up on shelves anywhere in the U.S. for it.

What a pathetic, sad excuse. Ever hear of Toad Computers? STeve's? Systems For Tomorrow? It's All Relative? Scarborough Computers? Computer Direct? These are stores that handle lots of ST software in North America - including new titles - and be easily had by mail order. Are you THAT lazy that you can't simply phone Toad and ask if they have what you want in stock? Toad is known for their fast shipping and prompt turnaround, so don't use "it'll take too long to get here" as an excuse. Or is it you're too CHEAP, Mr. Thief?

I have this feeling that your computer will explode from all the flames you're gonna get - especially from the developers on this conference - and I can't think of a more deserving idiot it could happen to at this moment.

G > I have a lot of great and rare stuff to trade for other, I
G > won't be a leech.

On the contrary, by posting this you've only proven how much of a leech you are. Get lost.

>type of situation?
>Perhaps this is related to my having a 80MB minix partition
>instead of 10MB. Does the minix driver store drive information
>in RAM?
>
Are you conencting with the option on the menu? ie. Don't run an xterm
or anything right from boot up - connected with the menu option and wait
for the ppp to kick in - then choose chimera from the menu - if you
have run a shell/xterm(or xvt) in a session you probably have some fragmented
memory - it is best to run chimera from a 'clean' system.

I have 12 meg so I haven't run out of memeory - I don't think the
minix parition size has anything to do with it - it has a cache size
built into the driver which I set very small before making the TAF disks.

Hope this helps,
Sam
PS. If you have a remotwer host that can run X netscape or Xmosaic, you can
use this and set the DISPLAY variable to your atari's ppp assigned address
and this will require almost no extra RAM. This is the preferred way to
do things - nowadays I run Netscape remotely and it is much faster
and better than Chimera.

One less leech? One less reason for the few developers still out there to throw in the towel?
-
G> Especially when there are NEWSGROUPS with names
G> like alt.binaries.warez.ibm that are
G> jam-packed and I wouldn't even have to ASK anybody.
G> Hmph.
-
Well then, your path is obvious.
I think it's quite interesting that you first claim that it's OK to pirate ST software because it's a dead market and no one cares, but now you're thinking of moving to the IBM because you can get pirate stuff easily. Of course, the IBM market isn't exactly a dead fish, is it? What lame excuse are you going to use for pirating on the IBM? Oh, I know - claim that the market is so big that those developers can afford the losses! Yeah, that's the ticket!

Hi,

I have just been back home at late night and I have received my Falcon.

With it, I don't have ram or hd.

I will get both tomorrow.

The question is that I have many stuff to get on with:

Falcon set up(video mode, hard disk, ...)
Quantum LPS 540S (Shouldn't be any trouble with it)
NVDI 3,
Screen blaster2,
CAF v2,
3 cubase modules.

And will be using either ahdi605c.zip from cubase ftp site, or my ICD
6.5.5.
Which one should I use?

I think I should get Falcon to wake up first. But then...

Which one should be the second? NVDI, Screenblaster or CAF?

Which one be the 3rd?

Can any clever help?

Please directly by email.

> I have been told ... that one of the DIP switches on the main board lets
> TOS know that you have a HD drive

Dip switch number seven. It needs to be switched to the 'on' position.

WARNING: Before altering any dip-switch, TURN YOUR COMPUTER *_OFF_*. (If you are absolutely paranoid, pull the power cord out of the computer - after switching it off, of course! Whilst you are unlikely to run into any problems performing this simple task, a little paranoia can save you a lot of woe.

If you undo the big screw immediately under the hard-drive, you should see a row of eight dip-switches at the front. Move switch seven to the on position. This enables "HIGH DENSITY" in the Copy/Format dialog.

Re-assemble your computer.

Plug in, switch on, and try it out.

Enjoy!

(My TT has been running like this, with an external DSHD drive for 18 months, and hasn't yet scrambled any data. BTW, some "cheap and nasty" high-density drives do not like formatting double-density discs when used in this setup - hence I suggest keeping a DSDD drive handy.)

(Awaiting a "You know nothing of what you speak" from R.S.)

2670. Wanted: Atari ST Monopoly

Newsgroup: comp.sys.atari.st.tech

Does anyone have the commercial version of Monopoly for the Atari ST or know of a place/person/company where I can buy it? Was there ever one?

My dad's been playing the Addison public domain version of it, and though it's a pretty good program, it does have bugs.

Thanks!
Gary

> So that gives me hope.

What's the problem? Sounds like you've solved it but don't know it yet...

Use the MS-DOS format disk, download the file to it, then stick it in your
ST. Your Mac won't recognize the file, but it doesn't need to since the ST
is your final destination.

If you've tried it, and you're getting errors etc, then post some details.
But your basic description of the process is right on target.

DS> But I really want to get some games off the net and play them
DS> on my good old ST!

If you are a member of GENIE, like me, you can get on the NET by just using your ST. I would d/l files to the MAC, format a disk on the ST (I am assuming you have TOS 1.4) so that it can be read by a PC, stick it into the MAC and transfer the files onto that disk.

... You, you, and you panic. The rest of you, come with me.

G > HEY, wake up!! It's the Atari ST we're talking about. Nobody
G > CARES anymore! To most people, it's a joke.

I am wide awake. I realize that the ST market is not as what it is. But there IS a demand, somewhat small, for commercial-quality software from a number of companies - who obviously DO care about providing a service for people here who DO care about their machines. Something that the selfish attitudes of people like you will only destroy. I suggest YOU wake up.

And the ST a joke? Try telling that to all the ST users who are still getting lots of mileage out of their machines. And in my neck of the woods, the ST has a fair bit of respect for what it's capable of - even from IBM and Mac users.

G > A reply like yours, instead of help or advice, just makes me
G > think that much more about throwing it out and getting an IBM.
G > Is that really what you want? One less ST user?

No, one less leech.

WHY should I aid or abett someone in an activity that will wind up destroying a small market and a number of companies who have given me strong support and updates for the products that I purchase? Not to mention an activity which, the last time I looked, is a FEDERAL OFFENCE, punishable by a LARGE FINE and POSSIBLE IMPRISONMENT, plus the possibilty of having your COMPUTER CONFISCATED. And believe you me, the Atari developers are willing to take action to protect their rights from being infringed by the likes of you.

G > Especially when there are NEWSGROUPS with names like
G > alt.binaries.warez.ibm that are jam-packed and I wouldn't
G > even have to ASK anybody. Hmph.

Sounds like if you DO go for the IBM you'll still be interested in only pirating software without paying for it. Just because there are entire newsgroups of IBM pirate software DOESN'T make it right - or legal - to do so. You are on very shaky ground trying to justify yourself, bozo.

G > Besides, I have BOUGHT my fair share of ST software in my
G > time, try and find it now, where I live.

Once again, as I said, there's always MAIL ORDER! It may not be as quick as popping down to the local store, but companies like Toad and STeve's provide quality fast service, up-to-date software

catalogues, and great follow-up, support and advice. But then, you wouldn't care, as you're only interested in one thing - THIEVERY.

Once again, kindly reconsider your actions. Is it worth it to help destroy a small market which is nonetheless STILL HERE for its users, who do NOT consider their computers a joke? Is it worth it to risk the possibility of losing your computer - or going to jail?

If not, then kindly stay out of this newsgroup with your grubby taudry justifications. Piracy makes me SICK - and is NOT an appropriate subject for aiding and abbetting in this newsgroup.

... Oh, YEAH? Well beam THIS up, pal!

The ST mono monitor is basically a mono VGA monitor. You can buy those for
under $100. You'll need to adapt the plug - you can either build one for about
$10 or buy one from a place like TOAD.

>and better than Chimera.

<blink> That will certainly work, but I don't know if I'd call it the
preferred method. I've had occasion to run both Netscape (slap, slap)
and Mosaic remotely, and even over a 28k8 connection, it's slooooooow.
We're talking five-second lag time just to display a pull-down menu.
And the "busy downloading" graphics are shooting down the line right
alongside the useful data. A local browser will almost always be much
faster than one running remotely.

2678. VGA Card for MegaST/STFM

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-28 00:00:00 UTC
From: gigxr01@nt.com
Message-ID: <gigxr01-2806951306060001@47.85.0.99>
Source record: 25597

Has anybody looked at the instructions for adding a PC VGA adapter (file ET4000.TOS) to an Atari machine?

I downloaded this file & while my German is not really good, I was able to follow the ideas presented in the texts.

It gives instructions for building an adapter that will allow PC VGA cards to be used on Mega ST's, but there are additional adapters for the STFM, which does not have a Mega-bus.

Some of the files are plain *.IMG files while others are *.PLT.
The PLT files are an unknown format & I can't read them.

The file contains software to support the adapter.
This project seems to be shareware, but I can't figure out the details without a good translation.

If there is anybody out there who knows more. please post , as I am sure there are others on this situation.

Gerry O'Rourke (gigxr01@nt.com) wrote:
> Has anybody looked at the instructions for adding a PC VGA adapter (file
> ET4000.TOS) to an Atari machine?
```

I talked with Torsten Lang via Email about his project (Mega4000) and here
are some infos:
- as Gerry said, it's a projoect that allows MegaST users to put an ET4000
based PC graphic card in their computer. This archive (ET4000.TOS) contains
image files of two different PCBs (for 2 different cards) as well as files
for the Scooter PCB software (for the Atari).
The software given is used to test the cards and to make a file describing
the different resolutions that the card can handle (from 6400x400 mono to
1024x768 256c) used by NVDI ET4000. Yes, you do need NVDI ET4000 in order
to use the graphic card.
The project is shareware, it means that the PCB layout is ginven free but
you must pay a fee to have the two logic Gals. Torsten, who is a very nice
guy (I think :-), has developped a special version of this two Gals which
allows you to test the adaptator (limitation: only 256Kb of video memory
can be accessed) before spending money.
It is possible to use the graphic card as an extra memory (max: 1Mb) with
a little programm.
Even though the instructions are in German, it is not very difficult to
understand with a dictionnary.
For the future: I will make a new PCB (in two or three months) because I
find that the traces and pads azre too small.
Finally, the price of ET4000 graphic cards is very low: I bought one for
less than $30 US (approx. 17-18 pounds).

>alongside the useful data. A local browser will almost always be much
>faster than one running remotely.
I generally run netscape even though I have no memory problems. At 14.4
I find it fast enough. Especially since all the data goes from the
outside to my school's system and a ridiculous speed (compared to a 14.4
modem). All I get is pre-dithered graphics and text - it is very fast
in that sense. Once in a while there is a delay going to the menu (generally
while a page is still being loaded - but its certainly acceptable)
The other nice aspect is I can still ftp something directly to my TT
while running a remote WEB browser and have it work at a reasonable speed -
since all the big data (256 color gif/jpeg) transfers are handled by my school
connection and it is cut down by a factor of 8 before it is even sent
over the modem! Chimera tends to tie of the modem when it is retrieving
a page (not to mention hogging a lot of memory). For people with 4

megs I would think running a remote netscape would be a better option.

BTW, to the person who asked about the TAF disks being put on GENIE, yes
everything on the disks is PD/free. You ordered from the TAF PD library
where the money is used to cover disk cost, administration/librarian
, duplication, etc. Just like all places that sell PD disks for a nominal
fee (I think TAF normally sells disks for $5, in this case you get
7 disks for $25)

Sam

There are several PD C compilers available. GCC won't fit in 1 MB, but
Sozbon probably will. Check out the ftp sites. I haven't seen Pascal in PD,
or COBOL at all. There is a very decent implementation of Perl 4.036, though.

No Perl 5 yet, sigh. I guess I'll just have to port it myself.

>Also, if I use a 14400 external modem on the Atari 1040STF with the

Yes, the 1040 will support speeds modem to computer of up to 19200.
That will still be a bit slow if you intend to transfer a lot of uncompressed
text, but will not be noticable when you are zmodeming zip or lzh files.
I do advise you to install hsmod drivers, though.

2688. FOR SALE: Lattice C 5.6/ Programming Books

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-28 00:00:00 UTC
From: ducky@enterprise.america.com
Message-ID: <3sssck$t0l@enterprise.america.com>
Source record: 25607
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech

I have been cleaning up my cleaning up my computer room and
have come upon several items which I no longer need. All of the items
are in excellent condition and will be useful to anyone wanting to
learn how to program Atari computers, and also to those intermediate
programmers looking for references.

Lattice C 5.6 - This is what I consider the finest C programming
package for the Atari line. This version includes
three excellent manuals covering all aspects of C
programming on your Atari and also includes 'Modern
Atari System Software' which has many sections
pertaining to the Falcon. This set retails for
$289.95.... Oregon Research sells it for $189.95...
and it can be your from me for $95.00 .

The Atari Compendium - This huge book is the most comprehensive
reference guide to the Atari computers.
Retails for $49.95... I'm letting you have it
for $38.00 .

C-Manship Complete - This is Clay Walnum's compilation of his
famous programming series from Analog and
ST-Log magazines. It is extremely useful to
the aspiring Atari programmer. Includes disk
with programs. Only $18.00 .

Atari ST Internals - A wonderful out-of-print refernce book to the
Atari computers. Does not include Falcon
information since it was printed long before
that line. This is the third revision and
includes sections on all of the integrated
circuits, interfaces, and the operating
system. Yours for only $27.00 .

V.D.I./A.E.S. quick reference books - This is a set of two
reference books, over 200 pages in all, which
summarize each V.D.I. and A.E.S. function.
Extremely useful to the C and Assembly Language
programmer. Both yours for $20.00 .

Compute's Technical Reference Guide to the Atari ST (Volume 1) - A
wonderful guide for the budding Atari
programmer...includes many examples for
programming the V.D.I. This is another
out-of-print book so grab it before it's

gone...only $18.00 .

Learning C: Programming Graphics on the Amiga and Atari ST -
Another useful book for beginning programmerrs
with numerous examples for programming simple
graphics routines. $15.00 .

Atari TOS Developer's Kit - This is THE item to have for all
SERIOUS programmers. Includes 2 notebooks full
of documentation and enough loose addendum to
fill another 1 and a half notebooks. Also
includes software such as the MADMAC assembler
and resource construction set. Get it before
it's history at only $95.00 .

**** Shipping is included for any pre-paid order inside of the
continental United States. C.O.D. orders will be charged added
UPS C.O.D. fee. Orders from other countries will be figured on an
individual basis. Discounts may be given to those who buy multiple
items.

Source record: 25610

Henrik Lunardi Weide (chainxor@kom.auc.dk) wrote:
: Can the SCSI ZipDrive be used with the Falcon030's SCSI-II port ?

Yes, according to Hisoft in the UK, they are compatible with ST's and Falcon030's (ST's need to get a SCSI adapter...)

: Is the drive supported by any Atari drivers (ie. ICD etc.) ?

Atari IDE interface (that controls the internal drive) should work with it as well..

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I seem to be running out of memory on a 4 meg Falcon too. Chimera consistently folds up on certain gif's. For example, every attempt to connect to Toad seems to be going OK, Chimera says its loading the main gif, and then closes it's window and drops me back to the desktop.

Can I configure Chimera to read newsgroups? How do I tell it the name of the newsgroup server? How about mail?

Cliff

One other thing to try, if your TV has a SCART connector
(the funny 22 ? 25 pin connector on the back of the TV)
is to connect the STe using the Video out on the monitor
connector. Using SCART bypasses the bit that encodes
the signal onto the TV's RF and you will get a better picture
anyway. If this works, the RF encode on the ST's mother board=20
is on the blink..
I use a SCART on a standard Mitsibusi TV and the picture is
actually better that the Atarti colour monitor and will
sync at 60Hz.
If you the pinouts of the monitor and/or SCART E-Mail
me direct and I will attempt to dig the info out.

> >for the Atari ST? I know they are out there.

Is this guy in the UK.. If so drop a line to
FAST (Federation against Software Theft)
How about giving them the addresses of any pirate sites as well.

In Europe there are now developers who ONLY produce
to the ST/STe market and pirates will kill these
small companies dead.=20

If this guys wants cheap S/W look in the second hand
market; I've had some good bargains there..
Look in at the Hensa site for excellent PD/Shareware
etc etc etc, BUT DONT STEAL....

Hey grubby, how would you like me to break into
your home and rip off all your software or break=20
into your bank and steal all your cash?

I search a LINUX drivers for ATARI TT serial port (38400Bds or better)
and a driver for VME graphic card (NOVA ATI 64 or other).

Thanks for Email Reply.

2699. MiNTNET - Where to find daemons???

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-29 00:00:00 UTC
From: ali@birnie.demon.co.uk
Message-ID: <804464404snz@birnie.demon.co.uk>
Source record: 25618

I am having trouble locating the various daemons needed for
smtp, nntp etc. Most if the sample inetd.conf files i have seen
include lines for in.smtpd, in.nntpd, in.routed, in.timed etc.

I have searched all the FTP archives that I know of but have
failed to find them. All the news/mail packages i've looked at
such as hermes and elm gloss over what actually gets the stuff
off the wire.

Can anyone help me? I'd be grateful.

Kenji, I just visited my local PC store and they have an adapter
card that takes the 2.5 IDE connector to a 3.5 size. The cost was
about 8.00 U.S. Its size was about 1"x3". You might give it a go in your
area.

Mike :)

2711. Atari SC1224 Monitor repair

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-30 00:00:00 UTC
From: edo@bcstec.ca.boeing.com
Message-ID: <DB04G4.3E6@bcstec.ca.boeing.com>
Source record: 25630

I've got a few nonworking SC1224 color monitors and am looking for a set of schematics to try and troubleshoot these things. Most seem to have trouble in the power supply areas (120v in, no power out) and a few have power, but no picture. I also have one that fades out to black, but comes back when you jar the monitor, until it warms up, and then it works fine. Any ideas?

2712. HD Problems with DMA Chip??????

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-30 00:00:00 UTC
From: mss@xs4all.nl
Message-ID: <3t1m43$ae5@news.xs4all.nl>
Source record: 25631

Hello World,

When I copy a certain file containing binary data to my HD floppydisk, my DMA Chip will get in a non-responsive state, and ASCI-communication and floppy-accessing will fail entirely.

Only switching off the entire computer will help solving this problem.

This happens only with a few files, others work fine.

Does anybody know what to do? I'm completely lost...

Thanks in advance,

Theo

(mss@xs4all.nl)

2713. Re: Wanted to Buy: Your old BYTE magazine collection, early '80s

Newsgroup: comp.sys.atari.st.tech

>Did anyone out there keep their collection of BYTE magazines from the
>early 80, particularly 1982? I am interested in paying a fair premium
>for them.

Wow, talk about nostalgia... The only two from 1982 that I could reach from my chair were Nov and Dec issues and guess what name figures prominently in both of them (yeah, yeah, we _were_ on top once!).

The November issue has an article entitled 'Computer Animation with Color Registers by David Fox and Mitchell Waite / The color registers on the Atari 400 and 800 give programmers amazing capabilities, even in Basic'.

The December issue had a lengthy article on 'Design Techniques and Ideals for Computer Games' wriiten by Chris Crawford, who lead the Games Research Group at Atari at the time.

One mail order ad in the back caught my eye:

ATARI - Word Processor
Atari 800 48K, Atari 810 Disk Drive
Atari Word Processor, 850 Interface,
Okidata Microline 82A printer with
Connecting Cable

Now Only $1,999.00 (US)

Those were the days.....

PS. after all that, sorry but my Byte magazines are not for sale

2714. adverts for barracuda 040 in French ST MAGAZINE

Newsgroup: comp.sys.atari.st.tech
Date: 1995-06-30 00:00:00 UTC
From: Oliver@ollom.prima.ruhr.de
Message-ID: <5oqzsKpLDhB@ollom.prima.ruhr.de>
Source record: 25633

In the French ATARI-mag called ST MAGAZINE (July 95, page 13), there are adverts concerning a new accelerator-card for FALCON 030, called BARRACUDA 040. Seems containing a 68040 with 33 Mhz and it seems having options for 128 MB RAM and a PC emulator DX 33 (whatever this does mean).
Does anybody know whether this accelerator-card is able to be delivered?
Does some of you already have such a card?
Or is this accelerator the same joke as Afterburner 040 seems to be, which seems never being sold?!

(This advert was published by FRONTIER SOFTWARE which sells the DIGITAL TRACKER for FALCON, too.)

CrossPoint v3.02

2715. Re: ICD Link 2 Info Needed

Julian Gifford (julian@connexus.apana.org.au) wrote:
: I am considering getting a Link 2 for my STe. A few questions please......

The Link II is is little bigger than the SCSI plug in size and plugs
directly into the DMA port, it has a power on light (handy). It is SCSI 1
& SCSI 2 compatabile and can be obtained from TOAD computer for US$90. It
works very well. A must have! Toad's addres is: toad@charm.net

Toplink from Gasteiner in UK (tel.0181 345 6000) costs just 40 pounds
(incl.VAT)

Also, the Translator from System Solutions
(ssolutions@cix.compulink.co.uk) Try them!

Hope this has helped!

Its a external device that pugs into a 50 way connector that are fitted
to those external Hard Drive cases. the Atari DMA cable plugs into the other
end of this device.......

It supports SCSCI II commands and NOTE: gets its power from the Hard Drive..

TOAD Computers....

Or ICD direct....

>Hello.
>
>I just got a Viking Mono graphic card for the Mega ST. Unfortunately I have no
>documentation or software. Does someone of you know something about this card?

It connects to SM194 19" monochrome monitor (1280*960 71Hz) - and to nothing
else (it's not VGA or RGB).

It needs at least TOS 1.4 to work. There's an AUTO program included,
BIGSCRN.PRG, which drives the card.

There's a place for Maths co-processor (16Mhz Motorola 68881) in the video-card.

I worked with same card/monitor/computer a few years - it's a very good
combination. Unfortunately I don't have it any more - I'll try to find the driver
software for you.

If you need installation advice, I'll copy/write the manual for you.

2726. ICD Booter 6.5.5. Problems

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-02 00:00:00 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <3t61ft$3ll@golem.wcc.govt.nz>
Source record: 25545

Well I am using ICD booter 6.5.5 with drives as 5/80/80/80 megs
with TOS 1.4..

To-day my E partition overflowed into my F partition, and stuffed
up the boot sector and the Fat tables..

As Ataries HD utils also has this problem, is this a GEMTOS Problem
and not the Hard Disk software...??

I managed to get my F partition back as I had saved this info with
CleanUp, but the BIG problems is that a lot of my Fat Tables are stuffed,
I will probably end up loosing some 30% of my F partition...

Or was it the Application software that stuffed it all up..??

Thier is a small TSR that checks for Drive overflows,
its called SENTINEL, I used to have this in, but did not this time,
I have now place this back into my Auto folder...

~~~~~~
How it works

Write Error Sentinel watches for GEMDOS Fwrite calls. GEMDOS returns
from the call, reporting the number of bytes that were written. If this
number doesn't match the number of bytes requested to be written, the
Sentinel reports it to you with an alert box stating:

```
-----------------------------------
| ____ THE SENTINEL REPORTS: |
| / \ An error has occured while |
| |STOP| writing to this disk. |
| \____/ The disk may be full. |
| |
| ---- |
| | OK | |
| ---- |
-----------------------------------
```

~~~~~~

Do any of you have some more thoughts on this....????

[Article crossposted from alt.music.midi]
[Author was selah]
[Posted on 2 Jul 1995 14:54:03 -0700]

can you please give me your comments, pros and cons ,
about cubase audio and the atari falcon?
you see i have the falcon and for 300.00 can gwet cubase audio.
i have four megs ram and 86 h/d.
i was told to buy AV quality hard drive (gig or more)
AV meaning that the platter (disks) will be of composite type material so
as
not to expand thermally like metal disks do.
the reason being that when reading or writing to the disk, calibration of
sectors needs to be flawless as much info is being transfered while doing
audio or digital recording.

DO ANY OF YOU HAVE A FALCON USING CUBE AUDIO? are you pleased?
i would appreciate hearing from europe as i know you guys are big on atari.
thank you.

The DOS box can't read Atari floppies, but the Atari can handle MSDOS formatted
DSDD disks just fine. Just use the MSDOS option on any of the many Atari
utilites tha format disks (I would NOT receommend CD-FORMAT though, as it
doesn't appear to be checking its work as it goes along), or alternately,
format a DSDD disk on your PC and use your Atari to transfer the files to that.

Having used Windows, X Windows, System 7, Windows NT and the beta version of Windows 95. I can HONESTLY say, yes I do like the ST desktops, Especially Neodesk 4.

I also find it interesting that Windows95 is looking VERY like the modern AES and System 7 desktops.

Would a fairer question be 'Do you think that windows is now as good as Atari GEM ????'

Steve Found.

> Alan Page posted the source on GEnie for those that think they can fix it...

There was an update to STorm itself and the Zmodem file transfer
module. I've been using the 1.2 version of both for quite some tiem
without any problems at all. Be sure you have the 1.2 versions.

2738. Atari Mega STE for sale!!!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-03 00:00:00 UTC
From: dogman@svpal.svpal.org
Message-ID: <3t7q86$132@borg.svpal.org>
Source record: 25557

```
I have the following Atari Computer for Sale:
:
: Hardware:
:
: Atari Mega STE 4
: 4 MB RAM
: 50 MB internal hard drive
: Magnavox ICM135 14" Stereo Color Monitor
: External DS(720K) Floppy Drive
: Supra 2400 Baud external Modem
: Beetle Mouse
: Atari standard Mouse
: Wico Joystick
: 3 2600 Joysticks
:
: Software:
: Pagestream
: WordWriter
: Word Flair II with FSM GDOS
: Diamond Back II
: various other utilities (Warp 9, look it, etc...)
: plus MANY GAMES (Dungeon Master, Empire, Uninvited, etc...)
:
: ************************************
Everything is in MINT condition, and I have the original
manuals for the software/hardware, as well as the orginial
boxes for the hardware.

I am asking $600 for the entire package. Please Email me at
dogman@svpal.org if interested.

AFAIK, the adaptor in the MegaSTE can only handle ONE hard-disk and it does
not handle parity too. Buy an adaptaor from ICD (The LINK2, AdSCSI+).

2740. Falcon DSP Trouble

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-03 00:00:00 UTC
From: richcsst@crash.cts.com
Message-ID: <DB5631.9CL@crash.cts.com>
Source record: 25559

I purchased my Falcon a few months ago, and from day-one I have never been able to get the DSP to do special effects. Let me explain. The Falcon works just great from DMA record/play, DSP Jpeg and Mpeg viewing, Graphics/sound demos, etc. However when trying to use a program that allows me to load a "LOD" file and use that with the DSP to creat special effects, all I get is annoying silence. I just want to have the ability to go from my CD player, to my Falcon, and then to my stereo or headphones and use an equalizer LOD file or a pitch bender etc. Each and every time I select to enable the DMA everything goes silent. I have used the included Atari programs, and WINREC, but both cause silence.

What the hell is going on???

I use FPATCH2.PRG and have tried booting with everything disabled (AUTO and ACCs). I even have my Powerup 2 turned off. Still nothing....

PLEASE HELP! I am quite knowledgable in electronic hardware, but I am not familiar with the Falcon's circuits and architecture. Is something broken? Everything else seems to be fine. Is there a logic chip somewhere that is unhappy? Is there a chip not getting a clock signal?? If so, then I'll fix it. I just don't know where to look, I have no schematic.

Thank you most gratefully in advance,

Rich

Thanks, I tried that but no joy. I found the source code (i think) on
ftp.cs.uit.no (Tromso univ) in /pub/NetBSD/NetBSD-current/src/sys/arch/
/atari but the files are huge and the site is very slow. And I dont have
local rates onto the net 8-{(. And i dont have the libraries to compile
them myself. If the sources are there, where are the binaries?
Specifically, I am looking for nntpd, smtpd, named, routed and timed.
Someone out there must be using them. Pleeese tell me where you found
them and I shall worship you for yonks.

Regards.

>Steve Found.

Or maybe the real question - why does it take windows 95 and most of their apps - tens of megabytes of disk space, megs of memory and a 66+ MHz processor to be able to run at the speed of our Atari's.

Those of us who like the Atari's do so because of the OS and because we have an intelligent architecture at the heart of our machines. We don't need half the world's computer resources (memory, disk, and cpu cycles) to run the programs we want to use. And we generally have all the connections we could ever want already built in for one price.

I'll take my Atari anyday. I'll keep supporting Atari software vendors. I believe they do care - they just don't care for piratez! Now where can we buy Expose'? Wayne

Bad luck Roger. I haven't had this problem myself, thank God - I'm using HDDriver and make sure I've got lots of room on each partition at all times. I'm also not sure that AHDI has this problem in all versions - just the one that first came out for the Falcon IIRC.

> There is a small TSR that checks for Drive overflows, its called
> SENTINEL, I used to have this in, but did not this time, I have now

I use that one too, but I'm not entirely convinced how good it is. I've got it set up in my boot-manager to install only when I boot into some badly behaved programs that don't report disk-full essages, like Timeworks v2.00a

> Do any of you have some more thoughts on this...???

It wasn't much I know... <g>

Firstly I would suggest "mix n match" your drive system on another Atari.
I had a problem slightly similar on my TT030. The problem was a faulty
hard drive... I have found the System Solutions technical support to be
superb and so I buy from them. (ssolutions@cix.compulink.co.uk) They
surely could confirm if the problem is the parity issue, etc. Please tell
us what the answer finally is...

I think the STE h/a is a slightly non-standard ICD card. It OUGHT to deal
with the ID selector unless it's been heavily modded.

IU> I have tryed (I've got a ribboncable and extra powersupply
IU> connection for it) but it seems that the AHDI just reccognise
IU> one of them.... and I have tryed to shift ID's and stuff..

Could it be, perhaps, the old termination problem? If there are 2 devices
on the same bus only the last should be terminated. If the first has
termination resistors in (or the TERM jumper set) the effect is to absorb
the bus signals which may mean the second drive is not getting a big enough
SCSI signal to be able to recognise it.

> Thanks.

As long as the disks are formatted on the ST with no interleve on the sectors
the PC will happily read them up to 10 sectors per track.

The desktop format option will be compatable with DOS as long as the TOS is
V1.4 or higher....

I have a ScreenBlaster on my Falcon. Same result, different device.
However, I don't have the software loaded on startup, since I have
a standard VGA, and the screen modes for VGA blow. In any event,
MiNT always barfs on me when I don't load GEM.SYS. I have TOS 4.04,
and just assumed it was something internal in the Falcon that MiNT
doesn't like or can't deal with.

: So, does anybody have a BlowUP + MiNT setup that _works_? I have
: FreeMiNT 1.12h4 (latest, I guess) on a Falcon with TOS 4.02.

How's your luck with FreeMiNT? I've had both 1.12h3 and 1.12h4 on
my system, and each time I would get lots of lovely messages like
"illegal instruction, operating system killed". NOT in alert.acc,
even tho it was running, but just blatted out... when I put
"regular" 1.12 back on my system, things worked better.

Hello,

I ran into the same problem over and over again when trying to run
MiNT _without_ MultiTOS. I tracked it down to having BlowUP
installed. The symptoms are: about one `normal' screen-size down to
the right of the mouse pointer (640 pixels to the right and 480 pixels
down, that is) there appears some kind of `ghost' pointer. When this
pointer touches the lower screen boundary, the system crashes. :-(

So, does anybody have a BlowUP + MiNT setup that _works_? I have
FreeMiNT 1.12h4 (latest, I guess) on a Falcon with TOS 4.02.

Mind you, with MultiTOS everything works fine. Strange, no?

Regards,

>v2.00a

All my BGM partitions had more sectors added to them than the standard,
a extra 144 sectors to all the 3 BGM partitions...

So the end sector was pointing past the start sector and even past the end of
the drive...

I could understand how one could get suffed up but how all 3...??

Its not very easy here to use German software, no support for one thing
and unable to use a credit card, and getting Marks from a bank just cost to
much, plus ICD came out way before the German stuff....

One other point was all my friends use ICD stuff here....

ICD gives me full suport on GEnie but up to a point...

I tried to get support for my Overscan and that mostly fell on deaf ears
from the UK agents, but I did after some problems got BBS support from Germany
from the Author....

P.S. I am wondering if its the Save/Restor feature in ICD CleanUp 5.08,
I did just test it and it did not cause a problem, but some thing did..

I bought quicktell - LogiCode voice/fax/modem 14.400. So now I'm looking
for any commercial/shareware software that can works with it (not only modem
but voice, fax too).

thx for help,

Simon.

2758. Re: adverts for barracuda 040 in French ST MAGAZINE

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-04 00:00:00 UTC
From: "H:WINSOCKKA9QSPOOLMAIL" <gary@gingram.demon.co.uk>
Message-ID: <600042504wnr@gingram.demon.co.uk>
Source record: 25574

The Barracuda 040 is real! It has a 33Mhz 040 (or optionaly the version without the built in co-processor), it has space for up to 128Mb of fast RAM, video card, 2 VME slots, an optional 486SX PC processor, and is fully compatible with the Falcons DSP chip.

Check the Falcon section of the Atari Web Pages for more details.

One massive downside, in the States it retails for $800 (Ouch!) without RAM or any of the optional extras.

No - this sounds like rubbish. TOS can handle 16 partitions A:\ through P:\.

BD> Does anyone know any ways round this?

Well, I think your diagnosis is wrong, Beric. You should have NO trouble
using 7 partitions on the two devices. It is more likely that something
has gone wrong with your partitioning.

You're going to find a 1-Meg machine (with no hard disc, I guess) very
limiting as a development platform. Buy the first second-hand machine
with 4MB+HD that you see. And the monochrome monitor that's with it.

That much being said: I have compilers for Modula2 and Occam which
should run in 1 Meg. I think I'm allowed to send you a copy of the
Modula2 if that would turn you on ... at one time people were running
gcc (GNU C) in 1 Meg, but I don't know where you'd find such a version
nowadays ... upgrade, and keep the STF so you can test your programs
on an Old Machine. Given 4M+HD, you can find commercial and shareware
compilers for C, C++, pascal, oberon, ... as for C*B*L, don't ever use
that word in this house again. :>

The hardware can do it, but old versions of TOS are rather weak in that
department. I use 14400 regularly on a MegaST with TOS 1.4 and the HS
modem patches; I don't know offhand whether HSmodem works on really old
versions of TOS.

Great.

I'll be very happy when I can plonk a URL on my desktop and open it
by double-clicking: and when I can have Thing-style "groups" which
contain a bunck of links to objects, some on my machine and some
elsewhere.

Separate www browsers are stupid. The Atari needs a www application
like it needs a separate "Program Manager" and "File Manager", i.e.
like a fish needs a bicycle. :)

I think older TOSses can only handle 4 'real' partitions overall, and
XGM is a way of getting round this. That would mean you should partition
the new drive into all XGMs. (Or repartition the old drive into a single
partition, and carry on from there). Or upgrade to TOS 2.06 or summat.

>

If we're talking about desktops, let me share one of my secrets with you:
I have been developing an object-oriented desktop (ObjectDesk) for ALL
Atari computers for ~3 years. It will be run with any TOS versions in any
resolution, even with 1M machines as it is small (~150k) and was programmed
clearly in GEM. The first version will be ready in August.

No other desktops matches for it in functionality (not just on the Atari
platform, but on PC/MAC platforms as well).

To make it short: everything is handled as an object, i.e. you can define
properties of several types and methods to these objects (files/desktop/
drives/printer/clipboard/trash/synth/modem/whatever). You will be able
to define your own object and set its behaviour soon.
Of course sophisticated file searching and processing will be part of it.

So be patient (and don't sell your ST till the end of August :)
/Attila

2768. GESoft software query

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-04 00:00:00 UTC
From: bericd@bri.hp.com
Message-ID: <DB6Lus.1Kn@bri.hp.com>
Source record: 25584

Hi,

I have the GESoft ASCI-SCSI adaptor supplied by Gasteiner along with
their HD Utilities.

This ran quite happily for a couple of years with a single disk mech,
but recently I have gotten hold of another drive which I wish to use
in parallel.

OLD Drive 46 MB - C: D: E:
New Drive 320 MB - F: G: H: I:

The problem is that TOS does not seem to like partitions G, H or I. I:
is not a problem as I use it for linux and that sees all drives as good.

Looking through the Gasteiner manual it says that TOS can only handle
up to 4 partitions without the use of these XGM partitions. Now I have
no more than 4 partitions on each drive. So no XGMs are being made,
correct?

Does anyone know any ways round this?

What a waste of money. There actually is a DIY instruction floating around
to make the MegaSTE adaptor capable of controlling two drives. And ICD
adaptors cost quite a bit of money, still.

About that parity problem: anyone with a PC or TT can switch it off, after
that the drive runs in every MegaSTE.

Here's the following for sale - US$700 o.b.o.:

* Atari 1040ST, dual drive system (one internal, one external), mouse and
all necessary cabling.

* Color monitor (SC 1224).

* Spectre GCR emulator cartridge. It gives a basic Mac Plus equivalent and
reads/writes to Mac formatted disks. (I'll include Mac software for word
processing if interested).

* IMG Scanner (cartridge based scanner to work in conjunction with the printer).

* Yamaha PSS 680 MIDI keyboard (with cables to attach for use with Music
Studio)

* Star NX-1000 dot matrix printer (with all my unused ribbon cartridges)

* I'll include my whole library of Atari ST disks (all my software collected
over the years).

FINE PRINT:
It is in great condition and I'd like to sell it as a complete whole if
possible. I'm in the New York City area and will consider selling outside
NYC if you're willing to pay for shipping. Price is negotiable...
Please e-mail directly.

Regards,
K.K.

Ah, vintage Sheppard... I guess I'm lucky I decided to do stretched screen adjustments, instead of "the scretched screen Ajustments". Out of five monitors I've adjusted (most back in 1986) only one has died, and I'm not convinced it had anything to do with the adjustment.

I've got one stretched SM124 that I probably have 20,000 POH on, that's still going strong.

If Roger only knew half as much as he thinks he does, he'd be a great source of information. Unfortunately...

I can confirm that the stretched screen on three SM 124 screens I modified
are still going strong after 3 years use, and they were already several
years old then... Also I know of many more gone dead from old age. I
notice that System Solutions has the LOPTI's for the SM 124, SM 125 and
SC 1426. These are perhaps the most common culprits of dead monitors...

>and not the Hard Disk software...??

In TOS 1.04 this shouldn't be a GEMDOS problem, in TOS 4.0 it is. In any
case some hard disk drivers (e. g. HuSHI, HDDRIVER) check partition
boundaries internally and thus prevent such accidents.

>Or was it the Application software that stuffed it all up..??

GEMDOS is responsible for writing data so it should check the partition
boundaries. If an application uses GEMDOS to write on a partition and this
leads to the result you observed it is GEMDOS' fault.
BTW, you should check if your drive is partitioned correctly. Maybe your
partitions overlap, indeed. In this case your partitioning software made a
fatal mistake.

The audio subcircuit (block diagram) from the DSP is as follows:
(from memory - my docs are at home)

```
68030 (DMA)
| |
|Host interface |
| |
DSP --------------SDMA ASIC----ADC/DAC----audio input/output
```

I assume that the DSP JPEG viewers work solely through the Host
interface between the 68030 and DSP. The fact that DMA playback works
implies that most of this chain is ok. If the problem is hardware, it
could be in the link between the DSP and SDMA.
Where did you get your .LOD files? Did you write them yourself?
Are they tested known-working routines? If they work on someone else's
Falcon in exactly the same way as you are trying on yours, then there
probably is a hardware problem, but I would imagine this section of the
Falcon is tested before shipping, and from experience it is nearly always
software which is at fault.
Report back with the answers to my questions above, and if
necessary I can tell you the IC numbers and pin numbers of the DSP-SDMA
link so you can touch them up with a soldering iron. Solder joints on
QFP package ICs do sometimes go dry and fail.

Paul

Doesn't matter what you do, the internal host adaptor cna only
recognize one device. You have to buy an external adaptor to use
more than one device.

The place you want is:
Mauritron Technical Services,
8 Cherry Tree Road,
CHINNOR,
Oxfordshire OX9 4QY
Tel: 0844 51694 (Pre phone-day)
Fax: 0844 52554 (" ")

They can certainly get you Sm124 (i got it there) and SC1224 (Likewise).
These are photocopies of the service manuals bound in a plastic folder
and contain shematics, component lists, adjustment details, sample
waveforms and test voltages etc. As i recall they were about 12 pounds
and excelent value. I have also had TV manuals, and all manner of things
from them. Give them a bell, but if you get stuck drop me a line and i
will see if i can get you a copy of mine, but i dont know when i can
get to a copy machine as i live in the boondocks. The st/mega manual is
a bulky job, schematic-wise, cos of the many `flavours', so i dont know
what that would cost. It cost me 15 quid to have it copied and bound.
I dont know anything about ste though.

Good luck.

>SC 1426. These are perhaps the most common culprits of dead monitors...

This does depend on how long the monitor is used for, if its only use 1 hour
per week it will last for many years..

And if you don't switch it on it should last forever...!!!

Go check out the dead monitor atricle on a few FTP sites...

When you do the stretched screen mod you end up overdriving a few parts,
one is the 'S' correction capacitor plus a diode and damping resitor,
after a while the PSU overloads and blows a fuse...

I have been 40 years in this trade so how long have you been a
Computer/Electronic Eng..????

P.S. Its far better to use Overscan, that does not overdrive the parts in the
monitor...

I'm looking for drivers for hard drives that you can connect thru the
parallel printer port on the St.

I'm thinking about getting a parallel portable hard drive for my ST.

I'm installing a 1.44MB drive in my STe, and for now I'm using it as a 720K
unit. I will make a HD circuit soon. I've written down the details
on how to install the drive mechanically, and how to fit it inside the ST
without cutting the case. Email me if you still need the info.

>will it still be 720kB? How do I do?

I done the above when my ST 720K FDD died. Just get any PC 1.44 floppy and plug it in. For the one I got, I didn't have to do any hardware jumpering on the FDD, but some other people over here have to. I guess it's the type of drive they purchased. You can only do 720K on that 1.44M FDD, you need a hardware mode on the motherboard to go 1.44M on the ST.

I believe that older (Much) versions of hard disk utilities used to have
some limitation like this. Certainly, anything produced now does C ->P.

Atari's CHKDISK program has disk selector boxes up to Z.

Is there anything available that will allow more than P:, ie. Q->Z
(skipping U of course)?

2795. 540Mb Fridge?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-06 00:00:00 UTC
From: Alan Mathers <alan@browns.co.uk>
Message-ID: <805020261snz@browns.co.uk>
Source record: 25464

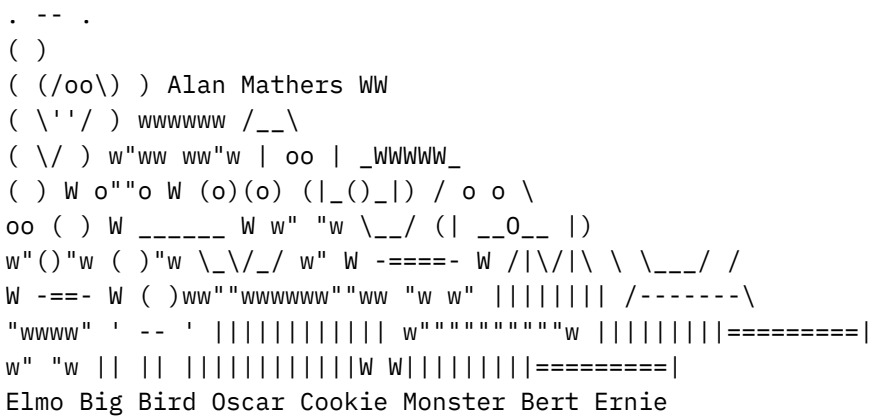
Actually, the fridge was a lie, but I would appreciate if you read on anyway!

My simple question is as follows:

I am using an STE with an ICD link DMA to SCSI convertor and a

Quantum ELS170S Hard drive.

Recently I have been getting 'out of space' even when copying small files
and as I have mainly .AVR files compression hence backing up is not a
practical soution.



I think it will be much easier to buy a second drive and on scanning
various (PC) adds have seen a

Quantum ???? 540M SCSI2 drive (11mS seek).

Does anyone know if there will be any problems literally adding the 2nd
drive to the existing set up. I beleive the ICD format and partitioning
S/W should be able to handle it but is this so?

My worst fear is is that partitions etc. may be corrupted, or the drive(s)
will fail!

Thanks alot in advance.....

2796. Re: Will DEC RZ23 SCSI drive work on ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-06 00:00:00 UTC
From: Ian Chamberlin <ian@bst.dec.com>
Message-ID: <3tgiog$5jo@usenet.pa.dec.com>
Source record: 25465

Eric,

DEC RZ23's work very well with Atari ST's and ICD AdScsi hosts adaptors - they are just like any other standard SCSI drive and give 104 Mbytes.

I'm not sure what the ICD error is, but there were three main things to do that I can remember with RZ23's :

1. Some RZ23's are set to spin up by the system they were used in, and do not spin up automatically on power up. This is set in the firmware in the disk, but can be changed.

2. You need to set the drive's SCSI ID using the jumpers on the drive.

3. There is a parity jumper on the drive which needs to be set correctly.

If you need more information, mail me off line.

Ian.

Pardon me? I simply posted my experiences with some SM124 monitors.
I'm afraid I don't see how that is rubbish, or makes me a moron.

> It a well known fact that the
> Stretched screen mod does stuff up your monitor, and that INFO IN ON THE NET,

You claimed that "all" monitors with the stretch mod would be killed by
it. I simply posted 4 counter-examples. Another poster had 3 counter-
examples. As did others. Your claim is simply wrong.

Although the higher deflection voltages do stress several components
more than in an unmodified monitor, a fatality is not inevitable.

> I am a Computer/Electronics Eng, of some 40 years standing,

Yes, I used a monochrome VGA as a substitute for my SM124 (which died).

Just wire all the signals to their corresponding counterparts and tie the
mono line to one or all RGB inputs (if using all, then you might want to
buffer the output).

DO NOT use the VGA monitor for color modes unless it is rated for such
low scan rates! Very few are. Mono mode, however, is at VGA scan rates.

: Is there anything available that will allow more than P:, ie. Q->Z

The HDX that comes with AHDI 6.06 seems to let you partition up to 20 partitions per drive. That's already past P, and by the time you chain two 20 partition drives together it will be past Z! As I understand it, as long as you have MiNT running, you can go past P and they will still be recognised, don't what happens when you get past Z though. I also believe that the HDDriver software allows 40 partitions per drive.

-Mario Becroft (mbecroft@iconz.co.nz)

2802. "Illegal Instruction" message

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-06 00:00:00 UTC
From: trek@ihgp6z.ih.att.com
Message-ID: <DBB3L6.FnJ@ssbunews.ih.att.com>
Source record: 25471

My son compiled a mush successfully, installed it and then ran the net mush program to get things going. When he does he gets an "Illegal Instruction" message and his prompt back. Can anyone fill us in on what we might be looking for? Will the illegal instruction be coming out of the net mush (although he had started other mushes this way) or is it more likely to be from his compiled mush? Wayne

2803. Atari Linux question

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-06 00:00:00 UTC
From: trek@ihgp6z.ih.att.com
Message-ID: <DBB3o7.Fsr@ssbunews.ih.att.com>
Source record: 25472

As of patch level 9.7 - is Atari linux a linux_0 or a linux_1?
Anyone know the difference? Wayne Booth

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
--------------------------------
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
```

to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on which the programs were intended, or in UNIX ....
- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available at your site. If you don't, ask your local system operator how to transfer files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

This was correct, the first lot of Atari HD software would Only let you boot
from a Floppy and Only have 4 Partitions...

From Memory it was Supra that came up with better HD software that ley you boot
from the Hard Drive anf have more than 4 partitions....

2808. Where to find 13-pin din plug.

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-06 00:00:00 UTC
From: Stephen LaBar <labar@rsoc.rockwell.com>
Message-ID: <3thotm$hej@popeye.jsc.nasa.gov>
Source record: 25477

I am trying to modify something which uses a 13-pin din plug. I was told that Atari uses a 13-pin din plug for some of their computer models. Does anybody know where I can find electronic parts for this kind of din connector. I would basically like to be able to extend the connector, so I need a cable to go from male to female, or I could make one from a plug and socket. Any help would be greatly appreciated. Thanks very much.

Steve

Run MiNT networking! Then you can either use PPP or SLIP and use
ncftp or nfs, all of which exists for MiNT! You'll need to use
the serial port, since there doesn't seem to be a reasonable
Ethernet device.

Or simply use any standard comms program on the ST, and download
the files from Linux

Get the Auto Overscan,. it works 100% for me, no the real one does not have
those hacks....

The Real one uses 2 Gals/Pals what ever and you get driver software that can
be set up for the program that don't like Overscan....

BIG NOTE: ONLY FOR ST,STFM and MEGA ST's....

The Plugs are very cheap here only $2.95nz but I have only seen PC mounted
sockets and they were not cheap...

SONY also use this conector as a Camera conector...

2816. MiNT and Linux

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-07 00:00:00 UTC
From: nickf@fleet.cadence.com
Message-ID: <NICKF.95Jul7143103@fleet.cadence.com>
Source record: 25396

Does anyone know if it is possible for me to connect my Atari ST
running MiNT to a PC Linux box? I'm primarily interested in
transferring files back and forward between the two. I know there is
software available to run on PC DOS but this isn't much use to me.

Thanks in advance,

Nick.

"too much noise"? Do you mean when you switch over? They shouldn't
induce any noise when they are still. The contact bounce could make your
monitor flicker a fair bit when you switch over however.
The video analogue gates you will need are fairly expensive aren't
they? You probably won't have too much succes if you intend to use a
high speed CMOS IC like the 74HC4066. Try and get a databook off Vitesse
Semiconductor. They do video analogue switches. As for the supply voltage,
I'm sure +/- 5v would be fine. As long as its a couple of volts more than
the signal you're switching in each direction. The video is about 1v ptp.

Is AHDI 6.06 generally available, or is a Falcon only version?

I am not sure that, even if you have MiNT running you can get partitions past P:
I have 15 physical hard drive partitions, & only 14 are seen by MiNT.

Of course you have the U drive installed by MiNT, but I believe that there
is some limit to the PUN structure (I might be wrong here) that limits the
number of active partitions to 16.

ICD had an ACC (CPX?) that allowed swapping of the active partitions, so
you could have more than 16 available & choose what you wanted to use.

Maybe the XHDI specification addresses this problem

>I also
> believe that the HDDriver software allows 40 partitions per drive.

Are there limits on the maximum number of Mbytes/partition, or can you have
40 x 32 Mbyte = 1.280 GBytes?

8 drives x 40 partitions x 32 Mbyte = 10,240 GBytes.

(I am assuming 1.3 G drives here).

AFAIR HDDriver allows partition size up to 512 Mbytes, so ....

You could have 40 x 512 Mbytes = 20.480 GBytes/drive.
If you were able to afford 8 of these (soon to be invented ;)
you could have 163.380 Gbytes total storage.

Please forgive my rambling insanity.

2821. Overscan info reqd.

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-07 00:00:00 UTC
From: jat5@york.ac.uk
Message-ID: <3tivhk$8d3@mailer.york.ac.uk>
Source record: 25482
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

I've just been trawling around some ftp sites, and I found details of the 'overscan' mod. Now, some of this seems a bit of a kludge (especially for mono monitors - setting pixel colours to black so that flyback beams aren't seen?). I also found a commercial overscan mod (Auto Overscan - in an old copy of STFormat) that conists of two chips on a circuit board - Incidentally the developer of the commercial overscan is the same guy that developed the PD version).

What I want to know is: How does the commercial overscan mod work? Is it just that you can change resolutions using software? Or is a new blanking signal generated by these two chips?

I'm going to have a go at the mod whatever, but I'd just like to know the difference!!

Thanks for any help.

john..

I have a Quantum Lightning 540 SCSI2 drive on the same SCSI bus as my
old NEC 40 Meg drive using the ICD host adapter hacked from the latter.
It works just fine, using ICD software.

Maplins, a well known UK electronic hobbyist supplier have these things.

13 Pin Din Plug - Part No JW95D
13 pin Din Chassis Socket -Part no JW99H
13 Pin Din In-Line Socket -Part no JW97F
Each costs about 1.50 UK, ie a couple of dollers.

Maplin Electronics
PO Box 3
Rayleigh
Essex SS6 8LR.
Tel. 01702 554161
They have an excellent Credit Card Mail Order service.
But I'm sure you must be able to get them closer to home.

You can fit a 1.44 floppy to your ST but you need an aditional bit
of circuitry to get it work. You may also have to get a TOS upgrade
in order to format 1.44 MB floppies.

>IBM all the time.

The unmodified serial port gives you 19,200 baud, so if you're
sending already compressed data over a 14k4 link, you'll get 14k4
throughtput, however, sending/receiving stuff which isn't compressed,
using say a BTLZ/LAP-M link (data compression/error correction) you are
theoretically supposed to be able to get upwards of 50k throughput (like
I believe that.. I've seen about 25k..) so your ST will max out
occasionally, just make sure your comms software, and serial port are
setup properly... i.e. hardware flow control, and the right version of
SERIALFIX installed...

Yes, the monitor connection is 13-pin DIN.

IU> Does anybody know where I can find electronic parts
IU> for this kind of din connector. I would basically like to be able
IU> to extend the connector, so I need a cable to go from male to female,

In the UK (you are in the states, aren't you?) the firm Maplins sells male
and female 13-pin DIN. You could try Tandy (Radio Shack) but I have never
looked there myself as they are expensive. You would also be able to get
them from Radio Spares.

Another approach is to get in touch with an Atari dealer - they often sell
made up leads terminating in a male plug.

Use the FalconScreen driver instead of BlowUp - I believe it works ok
with the same hardware (I use it without anyway). There are no problems
with MiNT at all (works with & without multiTOS and also works with
MiNT-X11R5 to give 880*640 mono X Windows).

2833. TT internal HD problems

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-08 00:00:00 UTC
From: thopman@uoguelph.ca
Message-ID: <3tkpo4$4d5@ccshst05.cs.uoguelph.ca>
Source record: 25402

I'm trying to upgrade the internal hard drive in my TT from a 48 meg Seagate ST157N to a 340 meg Maxtor LXT340SY. Unfortunately, I am having problems formatting the drive. HDX 5.00 tells me, when I try to format, that the root secotr is not found and that I should back up and reformat, a very unhelpful message, since that's what I'm doing. The drive formats fine with the ICD utils, so it's not the drive's fault, and I would just use them, but I need my host adaptor on my other machine, and the AHDI driver has problems with the ICD format. So: how can I format my drive so that I don't need the ICD utils, and so that it'll actually work? Any help will be very much appreciated...

Thanks...

THeo

Just an FYI... What you found was NetBSD for the Atari ST/TT. It is a standalone UN*X OS that takes over the whole box. I run NetBSD/i386, NetBSD/sparc, NetBSD/sun3, and NetBSD/mac68k. (well, not too much with the last 2, but I have them installed) NetBSD is very cool, if you are looking for UN*X for your Atari. If you want TOS _and_ UN*X functionality, I guess stick with MiNT. Check out http://www.netbsd.org if you want more info. There is a mailing list "port-atari@netbsd.org" also. (though send requests to "majordomo@netbsd.org")

David, B&C Computer Visions carries a manual for the Falcon that
was said to document the hardware. I know that they told me that
clock signals were documented. I believe that schematics are included.
However, with all the mods that the Falcons have had, this may just
be a general diagram at best. I would think that the power supply
should be consistant though. The price is rather steap at 50.00.
B&C 408-986-9960.

Good Luck

The Seagate st257? whatever that was in my megafile died a sad death :(.
I have a 20 meg Seagete MFM drive laying around, but it will not format.
I am using ICD formatting software (the one that works with all controllers).
Any ideas? Any suggestions? Mabe another drive that will work with the
controller? The 30 meg drives seem to be pretty rare....

Thanks in advance

Hmm... yes $50 is rather steep, especially if the manual doesn't include revisions, but it's also better than guessing :) Thanks for the info- I'll give them a call and find out more about this.

>blows up your falcon quickly!

Yes, I would think that, too :) I would rather just replace the power
supply with another Falcon p.s. - less risk involved as you say, plus there
would be the problems in mounting the PC power supply.

Theodore L Hopman (thopman@uoguelph.ca) wrote:
: I'm trying to upgrade the internal hard drive in my TT from a 48 meg

We connected the Link, formatted the internal, and external drives (the internal drive wasn't going thru the Link, but still formatted) install the ICD autoboot.
Then the drives work fine even after the Link has been removed. OTOH, I don't see why it won't format with HDX 5. We have used this with various drives with no problem. But maybe someone else knows :-). We have found the ICD utils can cause incompatibilities with some software, and believe AHDI would be better. Some people would disagree however. Also try the ICD Pro utils, this would save all the fuss.

Hope this helps, let us know how it goes!

> me.

Yes - its quite possible - I have a TT and a PC running like this. I've also had my STM working in this way - but with only 2.5Mb of memory it didn't really have enough RAM to do anything useful.

Basically you need to use MiNT-Net on the Atari to set up a SLIP connection. After this it is possible to set up NFS so you can cross mount Atari MINIXFS partitions under Linux! I've not successfully had Linux/pc partitions mounted under MiNT. There is some slight incompatibility somewhere in my system.

If you want to get really fancy it is possible to run a proper client server system using X-Windows. I use MiNT-X on the TT and run the clients on the PC. With this combination I get the benefit of the TT-Hi (1280x960) paper white display - but all the disk/RAM and CPU power of the PC. Of course it helps to have a decent serial link. I can do 115200baud, but 19200 is okay.

Hope that helps,

:-)

Roland.

It should be possible to use your mono monitor as a PC mono VGA screen and your colour monitor if you have a PC<>TV card installed in the PC. These cards aren't cheap however!

This question begs another question - Why do it when PC monitors a very cheap anyway?

That's exactly which you will be able to do with ObjectDesk,
(and much more). Define an URL kind and assign properties (URL, Last Visited, etc)
and methods to it (open method: call a program with the URL property as
argument for example, and other methods which can be accessed by
clicking with the right mouse button on the object(s)).

>
> Separate www browsers are stupid. The Atari needs a www application

Of course the Atari does not need them, it needs a *very* flexible
desktop (and file system) and we'll leave the PC guys far behind...

BTW ObjectDesk is an intermediate step to create an object-oriented
program development environment, which ObjectDesk will be the
framework for.

> the nice 3D effects of Falcon.

Of course.
I just finished the file searching/processing feature in the weekend.
E.g. when file searching, you can set max 4 conditions like:
cond1 AND/OR cond2 AND/OR cond3 AND/OR cond4
where cond1..4 are from 60 kinds of conditions!
Of course some of these 60 conditions search in the file (like grep).
With file processing you can do almost anything with the selected/found
files (rename, set dates/flags/version, add/delete property or method,
execute method...)

Nope. sorry. The CGA monitor is a digital RGB monitor with fixed RGB
levels. The STE requires an analog RGB monitor. Using it in monochrome
mode would also not work as CGA used NTSC scan rates, and mono mode would
destroy it.

You are better off selling it for the price of a decent supper.

The PD mod. can be found most places as OVERSCN3.LZH. It decribes how to build a simple circuit to manufacture Comp. Sync. and route it to the glue chip's Display Enable pin. There is also an auto program to relocate the video area in RAM and set display parameters.

The commercial version, I believe, is based around custom GALs so you wouldn't be able to construct it yourself.

>Anyone know the difference? Wayne Booth

All Atari (and Amiga) Linux versions 0.9pl* are based on PC Linux 1.0.9,
but some parts (eg. net stuff) are based on 1.2.9.

The current versions are 0.9pl8 (quite stable) and 1.2.10 (needs some work).

There was a graphics card to hook up a viking mono monitor to the Mega
ST. It does require TOS 1.4 or better. Gives something like
1024x960 (or close to that). Mine came with my monitor. TT uses a
different card but has same capabilities. Don't know if it would
work on an ste or not. Wayne

At least the bug is identified now. I suggest you simply use a disk monitor
to correct your boot sector data, i. e. set the number of sectors to the
correct values. You can do this without any risk that data might be damaged.

I succesfuly configured gcc 2.6.3, so I can compile and link C and C++ programs properly. Thats great. But I was be able to debug C++ programs compiled with gcc 2.5.8 under gdb 3.6 pl 4. And now I can debug only C programs. While I try to debug C++ (compiled with 2.6.3) I've got a message:

Reading in symbols for test.cc... invalid member type dataformat, at symtab pos 16.

Does it mean that I WILL NOT be able to debug any C++ (compiled with 2.6.3)???? I would like to use new C++ feauters like exceptions available at 2.6.3 (and with some bugs removed). I have many good ideas to write good C++ programs... Maybe someone have any idea.

I hope so ... i am very interested!

Does your desktop support TOSWIN with MiNT or TOS2GEM with plain TOS,
and parallel start/ARGV passing under MultiTOS/MagiC!3? Does it
support AV protocol? Does it have context-sensitive help?

Your desktop seems to be a bit like No|Desk - isn't it?

Ciao...

|> Mind you, with MultiTOS everything works fine. Strange, no?

I have Mint (1.12h or something like that) running with BlowUP, but there is
a trick: BlowUP has to be booted _before_ Mint, and you have to write an tiny
program (I can mail it to you on request) that sets up a BlowUP-resolution
(Mint X11 in 1024*768 :-)). So everything works fine.

Well, for UK viewers... look at the ftp site at src.doc.ic.ac.uk. The
file that you want is: /packages/atari/umich/Utilities/overscn3.arc.

This can be reached using a web browser, point it at:

ftp://src.doc.ic.ac.uk/packages/atari/umich/Utilities/

Hope this is of some use.

If the Logicode uses the Sierra chipset, then the voicemail of CoMa might work. (Doubtful). Otherwise it won't. The fax part of CoMa is brilliant though. Problem is, it's extremely expensive! If all you need is fax, and you want it in English, then STraight Fax is a clever little program which does everything a real fax machine does and more. I'm not sure which of the two I prefer, each has it's own interesting features.

STraight Fax AFAIK hasn't been updated in years, so it doesn't support Class 2.0 Fax, just Class 2 but no biggie there.... I have no idea where to get it from, but CoMa has recently been updated, version 3.60 I think, on ftp.uni-kl.de in pub/atari/incoming/ (Coma_360.zip/lzh) or something to that effect.

Don't worry, Roger, my desktop will (does) run everything ;)
I have seen Omen, but it didn't convince me, to be honest.

The trouble (?) with todays desktops is that they are just like
the Atari GEM desktop adding very little functionality. And they are
concentrating on having hundreds of 3d animating icons, which
will make them look like a toy rather than a tool.
This is my opinion of course.

/Attila

I think you should download and try CoMa (version 2.90 is just out).
Coma does all the things you mention (except outgoing modem), but it is fairly
expensive. OTOH, you can try before you buy and determine if the support for
your modem is good enough.

2885. Falcon and Mark Williams C Resource Editor

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-12 00:00:00 UTC
From: ujwb@uxa.ecn.bgu.edu
Message-ID: <3u0jnk$837@ecom4.ecn.bgu.edu>
Source record: 25354

I have a falcon that replaced a Mega 2. I had been developing apps
using Mark Williams C, of which I still use.

The compiler works, but the MWC resource editor has these problems:

1. The computer crashes when you exit the resource editor
2. The menu items that you create do not work when you
run the applications you compiled.

Any resource that I had created from an ST will run ok, so if I had an
ST, I could still use this.

I do have another resource editor from Atari as a registered developer,
and that works without crashing (although I haven't tried anything with
it), however, it seems to save files in a different format, so when I
load a resource, it doesn't pick up my H file.

The question is, has anybody gotten Mark Williams resource editor to
work on a falcon? Or if I have a big resource editor file on MWC, able
to convert it so that all of the .H definitions can be transmitted
to be used with other resource editors, such as the Atari one?
Do I have to get a computer from the ST line to keep using the
resource editor?

Thanks for any help.

Jeff

2886. SCSI - Harddisk on ATARI 1040 ST

In article <3ts2n9$bhb@gti.gti.net>, azog@gti.gti.net (azog) writes:
> And how pray tell does one achive virtual memory on a Falcon?

Using Outside or VRAM. I have VRAM and I have to admit it doesn't work
all that brilliantly with MiNT. Anyway I failed to get Chimera to run
with VRAM, sh crashed during X initialisation. (Remind me to find out
what causes sh to be run and see if it wouldn't be possible to use init;
that should save on RAM).

AM> Don't worry, Roger, my desktop will (does) run everything ;)

Ah, I feel better now :)

AM> I have seen Omen, but it didn't convince me, to be honest.

Nor me - who wants an operating system which can't run 99.999991f current software :(

AM> The trouble (?) with todays desktops is that they are just like
AM> the Atari GEM desktop adding very little functionality.

Well, I'm all for a good GUI. I've spent 25 years suffering with a command line i/f .

AM> And they
AM> are concentrating on having hundreds of 3d animating icons, which
AM> will make them look like a toy rather than a tool.

Yes,one has to learn to ignore the technicolour graphics and animations and ask the real question "Does this make life easier for me?"

AM> This is my opinion of course.

It looks as though I agree with most of it :)

2893. Mac utility to read st floppies?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-12 00:00:00 UTC
From: Daniel McGuire <dmcguire@igc.apc.org>
Message-ID: <APC&1'0'5bb52c41'941@igc.apc.org>
Source record: 25362

Many years ago I worked on an atari st, and generated many documents using the program STWRITER. I now use a Mac, and I wonder if there is any way to read those floppies using my mac (my atari dies a long time ago.) Any help wound be greatly appreciated. Please e-mail me at: dmcguire@igc.apc.org or post responses. Thank you.

2894. Once again, DSP problem...

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-12 00:00:00 UTC
From: richcsst@crash.cts.com
Message-ID: <DBLKM7.9zK@crash.cts.com>
Source record: 25363

Once again...

I am not able to use my DSP to modify incoming sound samples and then output them (in real time) to the sound port. All of the DMA, and other DSP functions work with the exception of this one.

All DSP programs (Jpeg, Mpeg decoders etc.) work fine. Graphics and sound demos work fine. DSP .MOD players work fine. However, using the DSP for effects does NOT work at all. I have tried both WINREC and Audio Fun Machine, and when I select a DSP mode all goes silent.

Is there a clock line or GAL chip that is causing my problem?? Please, all suggestions are appreciated.

Does anybody out here know why the 680x0 Linux kernel requires that a floating point processor is installed? I was surprised when I read this in the system requirments docs, as I would not expect the kernel to use floating point heavily, if at all. In fact, I have no clue what it is needed for. Anyway, I know a lot of people that happily use Linux (on their TT or their DOS-boxes), but I'm stuck with this Falcon _without_ a FPU. Is there any chance that, in the foreseeable future, a version of 680x0 Linux comes out that does _not_ require an FPU. Or should I buy a FPU (which is a bit silly, as I hardly do any math).

Hi All,

I have an STFM with PAK board and want to upgrade the resolution.

I have heard that the ET4000 board can be put into a Mega ST after a bit of hacking (Indeed I have the file from a.a.u.e to play with when I can get round to taking a 1.3Meg Compressed file home on 720k floppies) Can this board be used with a standard VGA monitor, and is it simply a case of making a processor bus extension?

Or have any other video cards been sucessfully added to ST's that can run on a vga monitor? (I have a vga monitor for atari hi-res)

I know there is the overscan mod - but for the much higher resolution and speed I will be prepared to buy an ET4000 card.

BTW which bus should the card be for? I have seen both VESA and ISA versions for sale.

Simon,

What is your system config? Is your GCC setup under TOS, MiNT or Linux?
If you have an '030 machine and are not developing for GEM, I'd strongly
suggest setting up Linux (I have no probs debugging c++ progs compiled
under GCC 2.6.3).

A h/w floating point unit is not required if you have a s/w emulator.
Unfortunately, no-one has written one yet (are you a programmer?)
There are a few reasons why a FPU or s/w emulator is required:
- an program which needs floating point support will use it:
- some standard unix tools such as awk need floating-point
- (and I think X11 needs it).
- the kernel has code to save/restore fpu context when switching processes

I wouldn't bet too hopeful about the s/w emulator, so you may be best off
buying an FPU. Mind you, it may come in handy if you plan to install X (I
could be wrong about this).

2899. AdSpeed/BLiTTER conflicts???

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-13 00:00:00 UTC
From: DOMINGO@news.delphi.com
Message-ID: <3u2npf$srm@news2.delphi.com>
Source record: 25368

I have a Mega ST4 with an ICD AdSpeed. I seem to be experiencing a BLiTTER conflict since I will get 10 bombs (I think that is the number) if I try to boot up in 16Mhz mode with the BLiTTER enabled.

Is there a cure for this? My current cure is to have the BLiTTER disabled by GEM in the DESKTOP.INF file. Then I manually switch to 16Mhz using the .CPX supplied by ICD. If I re-activate the BLiTTER there is a good chance that it will crash the computer.

I used to have T-25 installed in this machine and I don't remember having any problems like this. I also don't know if this machine had the BLiTTER daughterboard on the 68000. Is there an easy way to tell? Also, will the fix by ICD (the jumper wire to reconnect whatever was cut when the daughterboard was installed) solve my troubles? Or should I just disable the BLiTTER? (Can I just remove it?)

Thanks in advance!

Dom

Hi ! Walter

Yes its possible to connect a SCSI hard disk to the Atari ST.

You will need to get a host adapter such as ICD's ADSCSI or LINK which
connects between the ST's DMA port and the SCSI drive mechanism.

In the UK try Hisoft on +44-(0)1525-718181 or
System Solutions on +44-(0)1753-832212 for the ICD or other makes of host adapter.

Check before buying that the host adapter you choose will support the hard
drive mechanism you intend to use as some adapters dont like drives
that have parity enabled.

Yes, of course, _if_ there is an FPU present, the kernel should save its
context. The point is that if there is no FPU present, it doesn't have to
(and shouldn't) bother. Once the kernel is "FPU free" (which should be easy
if context switching is the only place where presence/absence of the FPU
matters), we only have to worry about certain applications that use
floating point. Now I, for one, can live without those (at least for the time
being). On the other hand, GCC can compile programs using floating point for
computers without FPU, if you specify -msoft-float. However, this requires
seperate libraries implementing floating point. In the GCC 2.6.0 distribution
there is a file floatlib.c which does part of the job (only single precision).
However, I'm sure there are other implementations floating (!) around.

>I wouldn't bet too hopeful about the s/w emulator, so you may be best off

>concentrating on having hundreds of 3d animating icons, which
>will make them look like a toy rather than a tool.
>This is my opinion of course.

If Icons will make a desktop looking like a toy is really YOUR opinion.
IMHO the original icons of "Thing" are really "serious". ;-)

But there are many things, wich you will not find in Atari Desktop:

- Console windows to run TOS/TTPs
- AV protocol to _integrate_(!!) file finders, packer shells (e.g.
one can use 'PacShell' with Thing or Gemini in a very comfortable
way - just drag&drop files from a desktop window to an archive to
add them and vice versa!)
- Support of tools like Kobold 2/3
- 'Object groups' (Thing) or integrated command shell (Gemini)

And... if running MagiC you can't use Atari-Desktop ;-)

I am really interested seeing the first releasy of you desktop - but
i think, if your system does not support desktop icons and a console
window for TOS/TTPs not many people will use it - because these things
are supported by nearly all other desks (Ease, Gemini, Thing etc.) and
many people want to use different icons etc. There are not only
programmers in the world ;-)

Ciao...

> support AV protocol? Does it have context-sensitive help?

Not at the moment. And it will not support them in the very first release.
Why? Because currently some other features have higher priority.
But...it will support them all later. (These are mainly cosmetic changes)

I like TOS2GEM and contacted the author, I will build it in.
I have old AES documentation so first I have to figure out somehow how to
start parallel programs in MultiTOS.
AV protocol? ObjectDesk includes same/more sophisticated features
than the accessories which use AV protocol, so it does not make too much sense,
I think nobody would use any of such accessories. But maybe later.

I have to take care of the size of the executable and keep it in the minimum.
Big programs are inelegant, inefficient, full of bugs (see Windblows).

>
> Your desktop seems to be a bit like No|Desk - isn't it?

No. It is not similar to any desktops I have seen so far.

2916. TAF MiNt Questions

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-13 00:00:00 UTC
From: bjr@PROBLEM_WITH_INEWS_DOMAIN_FILE
Message-ID: <3u26ae$86@Einstein.EbiCom.net>
Source record: 25385

So...now that I've devoted some 16 meg of HD space for MiNt...I'd like to learn a bit more about MiNt. I recently downloaded the TAF internet package and it installed without flaw. Now I'd like to add some things like maybe Tiny Fugue and IRC. A news reader like rtin would be nice as well.

First...what do I need to compile unix source on my 1040STe running what ever version of MiNt that comes in the TAF package?

Next...once I get a compiler...is it capable of creating the binary files to run basic unix clients and programs such as tiny fugue, rtin, irc, sox, zip, zoo, arc, etc...???

Provided all the above is possible...how complete is the library in the TAF package? Will I have to spend another month downloading library source in order to compile anything?

Finally...what make file should I use when attempting to compile a unix application for MiNt? I've noticed that when compiling stuff on my Sun account, there are usually several different make files that are specific to certian hardware requirements. Will I have to write my own Make files and edit half of the source, or will the standard stuff that come with most source packages compile fairly easy?

I don't know much about working with C...only the basics...like how to compile a program that has a nice make file all set and ready to go. Beyond that...I'm afraid I've much learning to do.

Any tips, suggestions, or locations of a good FAQ would be much appreciated. I've kind of browzed around looking for MiNt FAQs but have had little luck.

Thanks,
Brian

2917. TAF Upgrade Path? What's the Plan?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-13 00:00:00 UTC
From: bjr@PROBLEM_WITH_INEWS_DOMAIN_FILE
Message-ID: <3u27c2$86@Einstein.EbiCom.net>
Source record: 25386

Hello folx,
Recently set up the TAF/Chimera package that I downloaded from hensa.
I'm happy to say it is quite functional and worth the time and resources
involved in installing it; however, there is obviously room for
improvements and bug fixes (as with any software...espically the free
stuff :). Is there an upgrade path planned for us people who are very
daunted at the idea of finding and fixing unix related bugs as solutions
come about? Perhaps patches or scripts that will save your old config
in case something goes wrong, while swaping out or patching what ever piece
of the system is being improved? It would also be nice to see other unix
add ons in pre compiled binary form for those of us who aren't very unix
educated.
I would much like to see something of the sort come about, and would
be happy to support some sort of user group fund devoted to this effort.
Hopefuly someone will soon release something what will work without MiNt or
Linux soon, but untill then...this seems to be our only web option.

Thanks,
Brian

2918. Linux 680x0 , floating point and GCC

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-14 00:00:00 UTC
From: jhh@cwi.nl
Message-ID: <jhh.805705024@news.cwi.nl>
Source record: 25241

This is a little addendum to my posting of yesterday. I checked the GCC I have installed on my Falcon (without FPU), and it does compile and run programs using floating point. I checked the sources of my libraries (libsrc98.zoo) and lo and behold, they contain floating point emulation routines for single _and_ double precision (long double). So, the main ingredients to make Linux run without a FPU are there. The only problem: who's going to do it :-(. Now I know absolutely nothing about Linux, but I might volunteer if someone can explain me where the FPU dependent bits are, and how, in general, updates to Linux should be made.

>Someone told me that it is possible to attach SCSI-Harddisks on a
>Atari 1040ST computer. Who knows more about it and help me ?

You need a DMA/SCSI-Adaptor. ;-)

Buy one of many Atari-SCSI-Host-Adaptors. Connect this Part to your 1040ST
DMA-Port and connect your new SCSI-Harddisk too with 50Pin SCSI-FlatKable
to this Adaptor. Use new SCSI-Devicedrivers! (Software)

Call your lokal Atari-Dealer :)

Look at this Circuit: (My old 520ST)

(19Pin) (Vantage by Hard&Soft/Germany) (50Wire SCSI)
ST -> DMAPort --Wire--------> SCSIHost-Adaptor-----------Wire------->

(105Meg Quantum SCSI) = 210Mb Harddisk
>---------->Device 0 ----->Device 1--Term.

(Last SCSI-Device must be Terminated!!)
It is shown in the SCSI-Adaptor Manual....

First Step: Read this f(ine).. :) manual :-))
Second: Connect your Hardware !!!

Partlist:
1 DMA/SCSI Adaptor (inc. Devicedriver)
1 Manual :)
1 19Pin DMA-Kable (Wired to SCSI-Adaptor)
1 50Pin SCSI-Bus-FlatKable (Wired to your SCSI-Drive)
1 PowerSupply for your new Drive

Good look! :)

best regards
Robert (with very bad school-english..) (sorry) ;-)

John Maxwell Hobbs (jmax@interport.net) wrote:

: What sort of compression used with a .tgz file and where can I find a program to extract

.tgz files are TARed, and then GNU-Zipped. You will need two programs.
First is DETAR.TTP to De-TAR the archive, and then you'll need GZIP. You
can uncompres these files online on a Unix shell account by typing:

tar -xvf filename.tgz

Then, to Gnu-UnZIP them, type:

gunzip filename.gz

However, both TAR/DETAR and Gnu-ZIP are available for the Atari line and
should be avilable on most Atari FTP sites in the archivers section.
: them.

2925. TT030 screen goes into grey bands on bootup

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-14 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <3u4qfb$7ln@status.gen.nz>
Source record: 25248

The VGA monitor of our TT030 has recently started showing rolling grey bands when turning on the computer. The hard drive spins up like normal, but the monitor does not display any trace of what should be displayed.

After turning it off for 10 seconds or so and on again, it boots as normal.

The problem started out just happening occasionally a few months ago, but now it happens
all the time. It only appears to happen when the TT030 is turned on after having been off for about an hour or more.

The monitor is a Phillips 3CM9609 VGA monitor.

Any ideas about what could be causing the problem or how to fix it would be most appreciated.

-Mario Becroft (mbecroft@iconz.co.nz)

You need GNUtar ang GNUzip, both available at the common atari
sites. Then you can uncompress foo.tgz (which ist short for
foo.tar.gz) by

tar xzf foo.tgz

This won't work. You have to 'gunzip' it first and the 'detar' it. Or
you might get the GNU version of tar and do both in one using tar's z
switch (see my previous post).

2933. MintNet Setup HELP!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-15 00:00:00 UTC
From: "David D. Hagood" <73437.3162@CompuServe.COM>
Message-ID: <3u7atq$9s6$1@mhade.production.compuserve.com>
Source record: 25252
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

When I try to ping my TT on the net address I gave it, it says "Network unreachable".
I try to add my machine to it's own routing table and I get "Network unreachable". I can ping to the Loopback port 127.0.0.1 fine, but cannot ping 100.0.0.1.

Next, when I connect to the Net, I get in OK, but I cannot FTP/TELNET/PING anything other than my own system (Which mysteriously gains the ability to ping itself at 100.0.0.1, even though no data is going over the modem to CIS.) However, attempting to ping compuserve fails. Attempting to ping umich fails. Data goes out over the modem, but no data ever comes back. What am I doing wrong?

spn@hitec.com wrote:
: Is it possible to copy entire game disks to your ST Hardrive (like Ultima IV, for example) that do not
: specifically have hard drive install programs? It's really no fun to have a ton of hard drive space, and still
: need to play the things off disk....<sigh>

It depends... Physically copy-protected games don't generally allow themselves to be copied to HDD at all. Some unprotected don't either, unless one uses some trick, like "divert" program which tricks the games to think they're run from floppy even when they use hard disk. Unfortunately, most games developers haven't trusted ST-owners' honesty very much, or simply just haven't cared a damn. Therefore, Ultima IV doesn't work from HDD. Ultima V just might, with some imagination, and Ultima VI certainly does, and works even on Falcon without sorcery!

I strongly dislike the attitude of most major games publishers toward Atari world, even when they still bothered to develop for us. For far too many firms in the business, business is _everything_ - and making customers happy comes only second, if at all. That's not the way it works. People remember how they were treated...

I'll, for one, probably buy a PC for games machine, in the future. But will I support firms that abandoned Atari ST and Falcon without explanations, or even good reasons, by buying their games..? That will be a very good question! Why should we? They didn't care how we felt, after finding ourselves without many games - so why should we care, if piracy or whatever spoils their business..? I believe that good business respects customers. A business not doing that, just isn't worth supporting, no matter how many millions of copies some EA sells...

Software business stinks, unfortunately. People can't seem to make money without doing very unpleasant things to some other people. People like us. That's a good reason for ALL of us to support those good developers we have: games houses like Silmarils, makers of "Towers", ... You know, who make good job, and seem to care! Support them: register games, buy games, show them we appreciate their work =-) !!

: Regards,

Look in the newsgroup comp.sys.atari.st (no .tech) and there is
a rather long posting of Portfolio information. I believe it is the only
portfolio posting, so just skim through the headings until you get to it.
Sorry, I don't remember the exact heading.
You'll have to page through to the middle of the document, but
there is some information on hooking up a 1.44 MB drive to your portfolio.
The unit is very small, and you can leave it attached to your portfolio.

Why not try Cubase Lite?
This ia an entry level sequencer with pro features! and it is listed in
the TOAD catalog for only US$109!
One of the great things about it is that you have the graphical editing
and it also has a dedicated score editor. It has everything you are
likely to need to get started. Works on 1meg and mono screen.

>>format a DSDD disk on your PC and use your Atari to transfer the files to that

>I find that the DOS 6.2 PC's at work work fine with disks formatted in a TOS
>1.62 Atari STe...

You are right so long as the floppy was formatted in an ST which had
TOS >= v1.04 (a.k.a. "Rainbow TOS")

For those who don't have the luxury or time to copy all their files to
another disk after having formatted that disk on another machine, just
FTP yourself over to Atari Archive and look for ST2DOS. It's a program
for the DOS machine (can put it in the DOS subdirectory...) that will
re-write the critical stuff on the disk, thereby making the disk now
compatible with BOTH platforms.

I've installed an internal battery backed clock in my STe called the "Mega clock". It's from Germany, not sure who's made it.
I don't think just installing a battery will do- there's an electronic circuit involved here, and as far as I understand it this circuit "copies" the time/date information into the ST's clock when powered up.
Can anyone verify this?

>just a polite request for some info).

Its on most Sites, but the problem is one part HDX is 5.03c and the other
AHDI is 6.05, their are reports of 6.061, but from what I have read on GEnie
that this is a Hacked version of AHDI 6.05..

May be Julian can clear this up as he is the AHDI expert....

So grab HDX 5.03 and you will find AHDI 6.05 inside....

Well this is what I have read...

But if you need Real HD software get ICD Pro utils....

OK, so I have the TAF distribution (nominally) installed. I have edited my chat script so that I can call Compuserve's PPP server and get connected. HOWEVER, any time I try to do ANYTHING over the network, NOTHING happens. I see DATA going out to the modem. I DO NOT see DATA coming back. I can use the CIS PPP server with the KA9Q package, so I know it works. IFCONF on PPP0 shows that compuserve is connected. ISTATS shows that 4 of the received packets were dropped due to bad checksums.

INFERENCE: Once I have connected the PPP link, CIS does not like any of the packets I am sending, and is not replying.

Since I cannot get Chimera to work until I solve this problem, I am SOL. SOMEBODY, HELP ME! I know people have this working, so it must be something simple. Could somebody who is using CIS send my their config files so I can get this to work?

Well, I figured out my problem. The trick is to set the PPP options so that the PPP daemon will set the local IP address as well as the IP address of the end point of the link. Failure to to that will cause the link to be one-way.

Now, can someone tell me:
1) Where can I get TIN, the newsreader for the ST
2) Are there any replacement serial port devices for the TT that support direct setting of the serial port to baud rates above 19.2K?
3) Is the TAF distribution of the Chimera brouser set up with the correct URL's? I cannot seem to get it to go online, even though I can now FTP.
4) Has anyone done an X server that simply translates the X commands into GEM AES/VDI calls? This would allow X applications to co-exist with GEM, allow X to benefit from enhanced res boards, speedups from NVDI, etc. Having to choose between X or GEM sucks!
5) Does anyone know how to mount a file system under the NFS system? I have seen that certain sites allow AFS access to their files, and I assume (possably incorrectly) that NFS and AFS are related.

I don't know how easily it will compile on the Atari but tin can be found at
ftp.demon.co.uk:/pub/unix/news/tin IIRC. Perhaps there is a hacked source
around that will compile easily for the Atari..

> 5) Does anyone know how to mount a file system under the NFS system? I have

You have an /etc/exports for directories that are exported on your system, I
can't remember the syntax, 'man exports' perhaps. :-)

When you want to mount you do for example:

mount nfs_server:/exported_dir /mount_point

Make sure you have created a directory on your system to mount onto, eg.
/mount_point in this case.

As I said, you should be able to work this out by looking at the man pages,
ie. 'man mount'.

> seen that certain sites allow AFS access to their files, and I assume
> (possably incorrectly) that NFS and AFS are related.

AFS is Andrew File System, an enhanced version of NFS (Network File System)
developed at Carnegie Melon (sp?) University. I think most of the
enhancements were centered around security.

And yes, you can NFS mount src.doc.ic.ac.uk

If you are talking about the piece wich has to put into one of the OS-ROM-
sockets ... sorry, no!

The 'mega clock' (i use it also in my STE) _is_ the _same clock_ as the
one in the Mega ST(!). It contains an RTC plus a small address decoder.

Ciao...

All my problems I have either under TOS and MiNT.

> If you have an '030 machine and are not developing for GEM, I'd strongly
> suggest setting up Linux (I have no probs debugging c++ progs compiled
> under GCC 2.6.3).

Very funny...

Of course I need the gcc 2.6.3 to use with GEM, otherwise I have linux instaled and have no problems with debuggnig C/C++ programs under it (Is there anone, who has???). As I see there is no many gus programming in very useful C++ and/or **GREAT** GEM++ library. That's pity.

For a moment I fix my problem something like 'manually' but it works. Exactly the problem is that in gcc 2.6.x there is new builtin type bool

and the mentioned problems with gdb are caused by new non-standard
symbols generated in this occasion by gcc or maybe sym-linker. If there
is ANYONE (I doubt...) intrested, I can send him my own little utility
witch fix the sym file, so I CAN AGAIN DEBUG MY C++(gcc2.6.3 syntax)
PROGRAMS WITH gdb 3.6pl4 UNDER MiNT!!!!!!

Anyway if there is ANYONE developing for GEM with gcc 2.6.3 please

It seems almost *impossible* to find a proper mouse for the Atari
St these days! I finally ordered one from the UK, but got a crappy one
instead- it looks bad and the mouse pointer keeps drifting on it's own all
the time. Aren't there any *good* **HIGH quality** mice around, not cheapo
"Made in China" mice etc.?
I tried to find the Naksha or the Logitech, but neither is in production
any longer I've been told, the same goes for the Golden image. maybe my
trusty old original Atari mouse was better...

There's something about this thread which seems to addle people's
brains ...
tar (tape archiver) takes a bunch of files and wraps them all up
as one file, with a directory hidden inside.
gzip (GNU zip) takes one file and compresses it, producing one
(smaller) file as a result.
Both feel most comfortably at home in a unix environment, but can be
persuaded to run under TOS or DOS or similar. tar will quite happily
handle files with long, mixed-case filenames, which is one reason why
the pair are so often used for MiNT stuff.

To unpack a .tgz archive, it first has to be ungzipped (gunzipped):
gzip -dcf archive.tgz
Rename the resulting file archive.tar, and de-tar it:
tar xvf archive.tar

If you are running under MiNT and both gzip and tar are in the $PATH,
you can telescope this into
tar xvzf archive.tgz
which tells tar to invoke gzip to pre-process the file.

The parameters given are for GNU tar and gzip (if I've got them right).
Look for TAR1112 and either GZIP or GUNZIP on your local friendly ftp
site, or use the ones bundled in the TAF distribution.

One last point: it's OK to gunzip into an 8+3 upper-case filesystem,
because this step only produces one file and you can call it what you
like ... but when you de-tar this, do it on you minix partition so that
names like /usr/lib/X/app-defaults don't get munged. Of course no one
would be so stupid, but still I did it once ...

2967. Problem with SETUID - Can anyone help?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-18 00:00:00 UTC
From: ali@birnie.demon.co.uk
Message-ID: <806054100snz@birnie.demon.co.uk>
Source record: 25286

I seem to have a problem with SETUID, SETREUID, etc in my MiNT
setup. I am working on installing smail, using sendmail as the
smtp daemon. Whenever i try mailing to anyone other than root
the daemon fails with "setreuid failure (real uid=0, eff uid=0),
invalid function call", or something like that.

sendmail is mode 6755, as is login getty init and any other
chap i think may have a hand in this.

Similarly i cannot su to any other user unless i am root, even
if i am in the same group as root (0).

Any help would be greatly appreciated - I am lost.

Another problem (maybe related) is that when i log out or try
to login a second time, the system hangs after displaying
the login message and prompt. I am using mint 1.12, mintos 1.4.1,
on a 1040stfm, 4MB, tos 1.4.

Any ideas?

I mangaged to get things running better:
1) DO NOT USE A HARDCODED IP ADDRESS! Tell PPPD to set both the local
and remote IP addresses from what the remote host tells it.
2) Tell PPPD to add a default route when it makes the link.

I can now do FTP/PING, now if I can just figure out why Chimera doesn't find a
any URL's....

The hanging is due to a bug in 1.12, and is not related to your
setuid problem. Patch: get FreeMiNT, current version.

Did you compile it yourself? Maybe it's an old library version that does
not know the new calls.

> sendmail is mode 6755, as is login getty init and any other

This is ok, I think.

> Similarly i cannot su to any other user unless i am root, even
> if i am in the same group as root (0).

su should also have mode 4755 and owner root. If this is so, it should
work. Being in the same group as root is not enough because group 0 is
not treated specially like user 0.

> Another problem (maybe related) is that when i log out or try
> to login a second time, the system hangs after displaying
> the login message and prompt.

Do you use the original MiNT 1.12? If not, try FreeMiNT. There are some
errors of the original version corrected.

I believe this is normal behaviour for IDCHECK. (You can set which addresses
to skip, somewhere in one of the config programs.)

If your clock isn't working (i.e. not returning the correct time), it's
probably a battery problem. Try replacing it.

Emajic Logic is probably the very best and is well respected as the giant of giants or close, features galore including a virtual patch system, but Cubase is considered to be up at the top also and many swear by it. Logic took on some of the graphical side that Cubase has had for years. Logic is listed in the TOAD catalog for only US$349. That is half the price of what it cost in New Zealand. I would think that you wouldn't go wrong with either these packages, but I don't know the Mac sequencer you mention, to give you a totally informed opinion. There are web pages for Steinberg and Emajic. Maybe someone will post them up, I can't find them right now.

2975. Toshiba CD 3601 + Falcon 030

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-19 00:00:00 UTC
From: nat@zumdick.rhein-main.de
Message-ID: <FGTUDEAFUP@zumdick.rhein-main.de>
Source record: 25197

Has anyone encountered this peculiar problem ?

I have hooked up a Toshiba-CD 3601-B to my Falcon like this:

```
TermPower-Off TermPower-On
Falcon-------->CD-ROM-------->Conner
ID:2 : ID:0
: |
no term _ Terminator
```

Now the funny thing is, that when I copy using Kobold
complete hierarchies it works fine. I can tree check
both directories on the CD and the HD and its okay.
(So if there were errors and Kobold would ignore them,
they can't be random)

But when I copy even a small folder using the desktop, I get
"read errors" on some files (not always the same).

Anyone has any idea (no matter how far out), what the
problem might be ?

Nat!

From: macdonald@cfcsc.dnd.ca
Message-ID: <macdonald.67.000FFA0E@cfcsc.dnd.ca>
Source record: 25200

Hi:
I have a megafile case (used to hold my syquest, but i moved it to a tower case) with power supply and I have a 40 MB RLL drive from an old PC. The pins on the adapter board appear to be 50 pin, the RLL seems to be 52-54 pin. Is there anyway that I can hook up the RLL to the adapter board(from Atari) that is in the megafile44 case? I used to have a 20 MFM drive hooked up through an ICD (I think) adapter board on my STe, and if I still had it I could look at it and see how it was done, but I don't have (obviously :^) so I have to ask here. Any help appreciated.
thanks.merci

2980. ICD AdSCSI+ clock problem...

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-19 00:00:00 UTC
From: jat5@york.ac.uk
Message-ID: <3uivut$69i@mailer.york.ac.uk>
Source record: 25289
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hello,
I've got a problem with the real-time clock on my AdSCSI+ host
adaptor... My ST just won't recognise it - 'IDCHECK.PRG' skips over the
SCSI address of the RTC with the message 'skipped by IDCHECK' (or
something).

It did work once! Honest!!

Has anyone any ideas?

Thanks,

john..

Personally, If you want plenty of power under the hood, I suggest you
go for NOTATOR SL V3.xx then again its competition is no slouch either
CUBASE 3.xx

There'll be a file on your disk (forgotten the name) which will tell
idcheck to skip the address, also one of the ICD proggies should allow
you to set which devices are skipped and which aren't (i.e. it edits the
file for you.. wow). Been a while since I used ICD stuff but I think
that's right..

: I believe this is normal behaviour for IDCHECK. (You can set which addresses
: to skip, somewhere in one of the config programs.)

Yeah, but it used to say 'ICD REAL-TIME CLOCK' rather than 'skipped...'

: If your clock isn't working (i.e. not returning the correct time), it's
: probably a battery problem. Try replacing it.

Well, I put a voltmeter across the battery (in circuit) and it read
3volts, so I guess that that's OK...

Any other tips? (Is it possible that the clock is giving out an invalid
time/date that the ST won't accept?

I dunno.....!

I suppose that I'd better try a new battery anyway.....

Sometimes ago, I read that the maximum size is 32 meg.
But just today, someone told me that a patched AHDI 6.061 can reconized
size upto 2 gig.

Does anyone have more info? Where to get this?
Many thanks.

You might have set the "Skip SCSI ID's at boot" option in the driver. Go into the setup program (ICDBOOT.PRG) and tell it to check that ID (usually, 6). Then reboot and retry.

2988. Chimera trouble

Newsgroup: comp.sys.atari.st.tech

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Just downloaded the Chimera Web Browser/Mint(TAF) package and have installed easily without any problems. Everything - including FTP, TELNET, etc - works just fine, except for Chimera. I have 8megs of RAM, so I doubt that is a problem. When I click on a hypertext, I get "Can't load document." error -- on any and all links or hypertexts. I must not have set one of the addresses correctly, but I can't figure out what... Like already mentioned, PPP, etc, everything else works fine.

Please lend me some tips. Thank you.

If you want to back them up you can use CopyQM by SYDEX (Blind Mode), but
if you want to read them as DOS disks, it's a little tricky.
Try to edit boot sector of the original diskette (or better of a CopyQM
backed up one) with a good disk/hex editor (I prefer Norton's DiskEditor)
and change 3 first bytes to EB 50 90.This is a jump to boot sequence of
a standard DOS diskette.Of course you must first oblige your floppy disk
controller to accept any size of diskette.(I use FDREAD.EXE for this job
but there are also other similar utilities).In this way MAYBE DOS will
read these lovely ancient disks.(In fact it worked with some of mine
oldies.)Please be warned that you'll have no chance to read COPY
PROTECTED disks (mostly games), because format parameters does not
correspond to standard ones!

COMPLETE COMPUTER SYSTEM FOR SALE!

Atari 1040STf -- 1MB RAM, Internal Floppy Drive, Mouse
Atari SC1224 Color Monitor w/ Speaker -- LIKE NEW! WORKS GREAT!
Star NX-10 Printer -- with extra ribbons, paper & labels
Printer Stand -- adjustable, fits many printers
1200 Baud Modem -- with power supply & manual
Power supply & cable for external floppy drive (ext. floppy not included)
External clock with software
ICD SCSI Plus hard drive card (hard drive not included)
Extra Mouse
Joystick
Includes all cables, disk boxes, & extra blank floppies

LOTS of software -- almost 200 floppiesï¿½ worth -- such as:

Word Writer ST (word processor)
Data Manager ST (database)
Swift Calc (spreadsheet)
Interlink (telecommunications/modem software)
Degas (drawing)
Dungeon Master (game)
GFA Basic (programming)
Lattice C (programming)
and LOTS more!

Great student computer! $350 OBO, you pay shipping (I have original ST
box to ship CPU in).
Please respond via email! Thanx!

3000. MAC vs. ATARI ADVICE NEEDED

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-21 00:00:00 UTC
From: n.popovic@magnet.at
Message-ID: <294776767.862201@magnet.at>
Source record: 25219

I need some info on following questions - thanks !

With built-in MIDI in-out, low price and CUBASE Atari ST machines are really best buy products for home composing (and more) but only while you are playing with MIDI signals.
What is missing here is digital voice input for vocals. This ability you can get by buying Falcon with DSP,FDI,SCSI A-HD, digital mixer (like Yamaha ..01) and orig. CUBASE software.
All together (with DAT) is SOME money but still the cheapest Prof. system for CD post production or so...
Since I saw a demonstration of Mac working as MIDI sequencer AND recording vocals directly on HD within the same software. I came to this question:

!. Which Mac do I need/which OS-(7,7.5?)/hardware additions-MIDI-interface/A,A/V-HD /RAM?, or something more?

2. What is the name of Mac software vs. Atari's CUBASE-or what is the best/most popular Mac software and is it better than CUBASE?

3.If it is possible to use Mac as a digit. mix. with dig. input for vocals and direct disk rec. with good editor is the quality of rec. vocals high enough (is sampl.rate 44,1 ?) to go on DAT or does it need studio finishing?

4. Does it practically mean that I need ONLY MAC with some h/W add. as a basis?

5. Can I use Mac as a sampler?

6. Should I buy Mac or Atari ?!?

THANKS !!!

>
>The only otheres are the HD ones...

The keyboard ones do work but I found that the battery would run out after
a few days as it works by keeping the keyboard processor running.

There is another neat option which I have on my old ST. DALLAS semiconductor
make clock chips which fit UNDER an EPROM. On the old ST's you could just
pop one of the DS1216 chips under one of the eproms and have a small bit of
start up code which takes the time from the battery backed up clock chip and
loads it into the system time. The code would also let you set the time
in the first place.

On the STe you have 1M eproms so you would need a different clock chip but I
am sure that Dallas make one. I still have a few of the 256K Eprom clock chips
and the boot up source and exicuitable if that would be any good.

The clock chip has been very reliable and a nice feature.

Regards
Mike Wilsher

>for video production (such as genlock, CG, editing, etc.).
>
>Any info would be most gratefully appreciated. Thanks.

I have seen reviews of genlockers (hardware ones) in various ST mags.
I can't remember much about them though. I think they were little boxes
that you pluged your ST and a video player into and it placed the ST
picture over the video picture (or the other way round). I can have a
look in my magazine collection this weekend.

Also I have a VideoMaster cartridge from Hisoft. You stick it in your ST
and plug a video into it and it grabs pictures for you in black and white.
There is also a colour add on for it.

The host adapter in the Mega file is SCSI, so you will need a SCSI to RLL
adapter, these are no longer made, but some people on the net might
have one for sale...

3009. [Q] Fast RS232 port Hardware Mod? And RTS/CTS Bug?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-22 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <3upkc7$mdq@status.gen.nz>
Source record: 25228

I understand that there is a hardware modification which can be made to STs to allow the RS232 port to operate at over 19k2. Where can I find information on carrying out this modification? Will the modification work on STe computers?

Does the STe TOS 1.62/1.06 have the RTS/CTS flow control bug fixed? If not, where can I find software to patch this bug?

Your help is appreciated.

Mario Becroft (mbecroft@iconz.co.nz)

3010. Atari TT Still Available

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-22 00:00:00 UTC
From: msmith@aol.com
Message-ID: <3usep4$shm@newsbf02.news.aol.com>
Source record: 25229

Does anyone know if the Atari TT or Falcon is available new from any dealers? If so, what is the current price?

One additional question. Are any new Atari computers forthcoming.

Thanks in advance,
Mark

>I have Mint (1.12h or something like that) running with BlowUP, but there is
>a trick: BlowUP has to be booted _before_ Mint, and you have to write an tiny

I run MiNT (various versions, but FreeMiNT 1.12h4 and the 1.12 released
by Atari are two of them) and BlowUP together without problems. At least
none that are related to the screen, I should say.
MiNT is run from the AUTO folder and then BlowUP from the mint.cnf with
an 'exec'! (1008x608@4bit, TOS 4.01)

I'm beginning to think that there's some magic involved here...

>program (I can mail it to you on request) that sets up a BlowUP-resolution
>(Mint X11 in 1024*768 :-)). So everything works fine.

I think the original poster was talking about running under GEM, so no
special programs should be required.
Once I figure out why 'sh' crashes under Outside, I'd be very interested
in that program of yours, though.
Some programs insist on crashing, seemingly without any reason, when
Outside is used together with MiNT. :-(

has anyone ever used a 19" monitor on a falcon?
is there any 19" that support both color and mono?
please let me know..

does a Moniterm work on a falcon?
can the falcon be modified to make it work?

how about the atari tt194 (i think this is the model number of this)
anyone know how much they go for and if they will work?

thank you

3016. 520STfm memory upgrade

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-22 00:00:00 UTC
From: Callum.Lerwick@f47.n282.z1.fidonet.org
Message-ID: <7ea_9507230106@flight.org>
Source record: 25235

I have a 520STfm sitting here, and I am planning to upgrade it to 1mb.
(revision E motherboard, has an unfilled bank of RAM) I have a bunch of RAM
chips pulled from an old PC that are the correct type, and I know what kind of
resistors I have to put in, all I need to know is what type of
capasitors I have to put in. Help me out.

3017. PC mouse for Atari ST?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-22 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <3uquvt$fif@sinsen.oslonett.no>
Source record: 25236

I got an article from someone on the net where it said that it was
possible to use mice made for MSDOS type machines:

|> don't know if this has been asked before, but what would be
|>involved in making a little black box that would allow you to plug
|>a PC serial mouse into the ST mouseport?

|| This can already be easily done, with no hardware adapter needed.

|| A standard MicroSoft compatible serial mouse can be used in the
|| regular ST mousport, but it needs a software driver.

Anyone know anything about this? I have a mousedriver already, but it
only works with mice connected to the serial (RS232) port, and as I
have an STe I only have a single serial port (which is obviously used
for a modem since I'm able to write/send this).
Are there other ways to connect a serial mouse to an ST?

>A standard PC *bus mouse* can be used with no software drivers
>needed, but some slight modifications to the wiring of the connector
>are needed.

Hmmmm.... Haven't heard about those. They're not used very much for PCs
are they? I haven't seen any in computer shops anyway.

I'd really like to use a standard serial mouse with my STe (since it
seems almost impossible to get a proper Atari replacement nowadays).
So I'll take any information out there regarding the subject and
hopefully be able to use one with my STe.
Thanks.

Hallvard

There is a very simple mod. involving a switch and 4040 chip which set the DTE speed to 39K4. It was described in ST Applications Issue 40 page 35, if you can get hold of it. I think it has been written down in other places - try your local BBS text files.

Yes, it works on STFM, Mega and STe.

MB> Does the STe TOS 1.62/1.06 have the RTS/CTS flow control bug fixed?
MB> If not, where can I find software to patch this bug?

Errm... if you are going to run at 38k4 DTE you need HSMODEM06.

Hi.

I'm trying to locate a guy who lives in New Zealand that offered to help me
set up NOS 0.42 a while ago so that I could use PPP.

I lost the address, but think it's something like:
john@southern.co.nz

If anyone knows this person - could you please let me have his address?
And ofcourse, if it's John reading this - please mail me...

Thanks,
Richard.

PS. Sorry to all of you that this e-mail doesn't apply to - I'm just trying
to understand the NOS thing.

To: The one maintaining MiNT libraries for Lattice.

This is message is to the one maintaining MiNT libraries for
Lattice C.

The following errors come when using mintlibs (PL 46):

I compiled just a basic program that used no functions at
all, just the C defined keywords, and the linker returned
the following error:
Undefined symbols
__CXOVF

When some header file uses the sys/types.h file (like ext.h)
the following errors come with the compiler:
typedef __clock_t clock_t;
^
\headers\sys\types.h 86 Error 72: external item attribute mismatch
{ fd_set;
^
\headers\sys\types.h 116 Error 72: external item attribute mismatch

If I try to use getcookie call from cookie.h, the linker reports
the error:
Undefined symbols
_getcookie

I have had both. I started with a 1040, had a Mega STe4, and finally went over to MAc when the last dealer in town went belly up.
The mac environment, with the System 7.5 is FAR superior to the Atari , if for nothing else in terms of available and new software from MAJOR companies.
I stuck with Atari for as long as I could. After owning the Mac, I do'nt know why I never started here to begin with.

You will need 1 x 33 ohm resistor (R73) for RAS1
2 x 68 ohm " (R71 & R72) for CAS1H and CAS1L
16 x .22 mfd capacitors across each chip.
Use quarter or sixth watt 11r 5 0.000000or the resistors.
Disc ceramics for the capacitors. All are pennies from maplins.
Use a tiny soldering iron (15W) with a pencil bit (if you havent got
one get one - it will come in handy).
Switch on and you will have 1 Meg.
Good luck.

Source record: 25295

I currently use an Atari Mega ST4 for MIDI stuff in my home studio, running Emagic's Logic 2.01. It works great, but ...

I also have a PowerMac 6100/60, which i'm on now. After getting OSC's Deck II 2.2 hard disk recording package for this thing, i'm ready to cross-grade my Atari Logic package to Logic Audio Mac v2.5 (which has been optimized a bit for the PowerPC in the PowerMacs). It's amazing!

My Atari has served me well for things MIDI, and i'm sure after I move completely over to the PowerMac and get rid of the ST, it will serve someone else well. It really was a great system for it's time, but that was a while ago, and it's being eclipsed by the new stuff.

Now, I don't know about the Falcon. I've never seen/heard one. I was debating between the Falcon and this PowerMac, I chose the PowerMac because I feel it has all the features important to me, and this 60MHz PowerPC is _way_ faster than a 16MHz 68030 ...

3028. Re: MAC vs. ATARI ADVICE NEEDED

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-23 00:00:00 UTC
From: n90photo@aol.com
Message-ID: <3uui09$do8@newsbf02.news.aol.com>
Source record: 25297

Plus, you have to think about this simple question:
What company will be coming out with upgrades, new stuff, and customenr
support in 5 years? Atari or Apple?
That question was a major one in my decision as well. Face it, the
Trammiels had their day.

3029. Re: [Q] Fast RS232 port Hardware Mod? And RTS/CTS

Mario Becroft (mbecroft@iconz.co.nz) wrote:

MB>I understand that there is a hardware modification which can be made to
MB>STs to allow the RS232 port to operate at over 19k2. Where can I find
MB>information on carrying out this modification? Will the modification work
MB>on STe computers?

It will. The easiest thing to do is to use a divider (I think :4 is needed)
and create a fixed clock which you feed to TxCLK and RxCLK on the MFP68901.
Doing so, you get a port running at a fixed rate of eg. 38400 bps, regardless
what your software thinks it is. If you add a switch, you can turn it off
easily.

There should be a more concise doc on this somewhere ... maybe on ftp.cs.uni-
berlin.de - don't ask me about more details, I have nothing more written down
here.

MB>Does the STe TOS 1.62/1.06 have the RTS/CTS flow control bug fixed? If
MB>not, where can I find software to patch this bug?

Use HSMODEM (HSMODA06), Harun Scheutzow's greatly improved RS232 routines.
Besides fixing RTS/CTS and other bugs, they will enable you to use 38400
bps with a stock 8MHz ST.

HSMODEM should be on the cs ftp server in berlin, too.

cu

3030. MiNT PPP problem?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-23 00:00:00 UTC
From: boik@cix.compulink.co.uk
Message-ID: <DC6wvK.58F@cix.compulink.co.uk>
Source record: 25299

Hi! I wonder if any of you learned types out there might be able to help me with the above problem?

I've recently installed the TAF MiNT distribution (great work boys!) and evrything works fine, except for one key area. I can't seem to get a complete Internet connection using pppd. I've modified the chatfile, and on the syslog I can see a connection being made, and userid and password being accepted. I get a PPP0 connected to modem2 (its a falcon), but after a minute or so I get....

IPCP timeout sending config request

Chimera and FTP are unable to talk to the outside world! I have used this account with PPP on a PC using Trumpet Winsock, and everything works fine. The first few lines of the winsock .ini file are:

IP=xxx.xxx.xxx.xxx
netmask=0.0.0.0
gateway=0.0.0.0
dns=yyy.yyy.yyy.yyy zzz.zzz.zzz.zzz

(where x,y and z are real ip addresses!). I guess it must be an IP addressing problem or a pppd options problem, but can anyone with a working system advise? I'm afraid I'm a bit of a novice where PPP is concerned. What should go in the various host.* and resolv.conf files? Sorry if it's something dumb I've done!

TIA

Graham Burst - boik@cix.compulink.co.uk

Could be _the_ Falcon hard disk problem. But i suggest you try terminate
your CD ROM drive as well as the harddrive. (Yes, you heard me right,
terminate both devices).

Increase the stack size of mv, to about 10K. When moving between
different devices it allocates a buffer of 8K on the stack.

Source record: 25304
Cross-posted to: comp.sys.atari.st.tech,demon.ip.support.atari

I have noticed that when my modem (US Robotics Sportster 28.8) connects at 28800, the thruput is much lower than when it connects at say 26400 or 24000. When i say much slower I mean about about 1 Kb/Sec as opposed to 2.3 - 2.7Kb/sec. I think this has something to to with symbol rates and S register settings, but I am out of my depth with these new-fangled modems. In MY day, modems were the size of a large shoebox and you were king comms if you could get 4 terminals doing 9600 on a 4 wire dedicated circuit. Ah, how times change. Any help/suggestions would be gratefully received.

Obviously I have the CD4040 mod and HSMODEM06.

Message-ID: <3uusor$n4p@golem.wcc.govt.nz>
Source record: 25305

I have an Atari Mega2 with an ICD internal (micro host adaptor) SCSI adaptor
and I would like to attatch a CD drive. Two questions.
1/ Any comments about the PROCOM range of 2Xspeed drives and use on an Atari
2/ Can I daisy chain the SCSI signal from the back of the micro host onto the
CD drive, orwould I still need another SCSI adaptor of some sort. I have a second
MICRO Host adaptor if that could be used?

Thanks for any help.

I hope somebody can help me.
I am trying to compile freemint (1.12 h4), and I have been unable to compile
it with GCC. I used GCC 2.3.3 (I also tried with 2.5.8 with the same problem).
I used the libraries pl 46, and linker from utlbin38.

No matter what I try, I get several undefined symbols in the link phase.
This is weird because I was able to compile the source with other compilers and
they did not complain about those symbols (but MinTs compiled with other
compilers had other problems I won't get into).

Can anybody tell me what I need to define the symbols missing below?
Thank you very much.

I don't think so but if you're in Southern California I've got a TT030 with both color and 19" mono monitors, a Mega 4 w/SH205HD and both monitors all for sale. Make me an offer. I'm verging on desparate due to a pending debt. I'd be thrilled to get $800 for the lot.

I think Atari decided the video game business was easier. Its a mass market with less problems of being taken seriously. If the general public, particularly in the US, is incapable of recognizing a machine with the Atari badge as other than a toy then they might as well take advantage of it.

You need 0.1uF caps. They usually have '104' marked on the body which means
10 followed by 4 '0's in picoFarads i.e. 100000pF which is 0.1uF.
I would guess that the value is not too critical. 0.1uF is a general size for
memory-chip decoupling. Disk ceramic or tantalums should be fine. Watch the
polarity if using tantalums.

3041. Memory-Mapped I/O hack

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-24 00:00:00 UTC
From: jwasinge@slate.Mines.Colorado.EDU
Message-ID: <3v0jkb$160i@slate.Mines.Colorado.EDU>
Source record: 25310

I would like to add extra memory-mapped IO chips to my ST. My goal is to add an extra MFP 68901 or Yamaha sound chip (for some digital I/O lines) and a A/D converter(w/ analog multiplexer) chip. I hope to be able to control several motors and read several real-world sensors with this project.

I can obtain most of the Address/Data and some of the control lines I need from the ROM cart. port. The rest of the lines I can extend from the CPU itself or from other points on the mother board.

I have a question though about the ST's "MMU" and Glue chips. I know that the Glue chip decodes the 68k address bus and generates appropriate chip select signals. I can add logic on my project board to decode a presently unused section of the memory map and generate my own chip select signals. So, my first question is: What are safe regions of the memory map to use for this???

My other main question is about the Bus or Address Errors that the MMU chip (I think that this is correct) generates if it sees an illegal memory operation. Is the MMU hardwired to reject any memory I/O to addresses which were not part of the original Atari design ??? Or does it just signal errors for I/O outside of the 4M limit or word/long I/O to odd addresses? If I build decode logic that selects a perip. chip's register in an unused portion of the ST memory map will the MMU (or Glue) generate a Bus or Address Error? If so, does anyone know of another way to add extra memory-mapped I/O chips to the ST h/w?

BTW, if anyone has done something like this I would be very interested in hearing about your modification.

Thanks!
John Wasinger
jwasinge@slate.mines.colorado.edu

Perhaps you can solve both problems:
There is a new program out of Germany that allows you to run Atari TOS on a Mac. If you buy a powermac, you will have an Atari running at 66 mhtz or faster.
Of course, I got a letter today that said this thread was not "TECHNICAL" so perhaps you can't use this information. Th emoderator doesn't like NON TECHNICAL messages..

3044. Re: Atari TT Still Available

I prefer using my PC but have a Falcon for HD recording. I don't understand that you compare Atari and Mac. We're in 1995. When Apple had Mac models like Plus and SE30 (maybe LC20) it was fair to compare. If I had the money (I've spent them all on Falcon and utilities!), then I would buy a Mac size "grande". But as I started out this quote. I rather stick with OS/2 if I'm -not- using MIDI/Audio :)

/Lars

3047. ibm hard disc

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-24 00:00:00 UTC
From: rcain@nest.demon.co.uk
Message-ID: <2068rcain@nest.demon.co.uk>
Source record: 25316

I have an IBM WDS 3160 hard disc extracted from a PS/2 Model 80 (I believe). It is supposed to be a SCSI-2 device of 160Mb formatted capacity. Because it was custom made for a particular machine there are very few jumpers for user control - just a block for SCSI ID. There is another jumper block (J6) but I have been told these are for "engineer use only".

It spins and is a dinky fast disc I'd like to use on my ST/ADSCI+ config.

Here is the prob.:

Fomatters and editors won't touch it - generally give "Unable to read/write".

I have used the ICD SCSI.PRG to investigate further.

TEST UNIT READY - OK
START UNIT/STOP UNIT - OK
INQUIRY - send Vendor ID=IBM, Product ID=KZ-P
REQ. SENSE - seems generally OK but tends to send additional sense byte $20 (Invalid command op. code)

All other commands (and I particularly need MODE SENSE, MODE SELECT and FORMAT!) send Return code of 2 with sense code $20.

I am confused and hair-tearing! Why does some of the SCSI command set work and the rest not?

Has anyone ever met this device or, more generally, anyone know what is the real problem behind this behaviour?

Roger

I am assuming the PAK already uses the ST memory & has no memory of it's own.
The easiest way is to use one of the memory controller IC's (nationals
8422a springs to mind) which will take care of all this + refresh.

Or, you could use some counters & make it simpler/cheaper.

The big problem might be ensuring it looks like genuine TT Fastram & I
don't really know how this is done.

I assume the TT has some sort of memory controller, that manages the
memory from 4 meg upwards. Maybe one the the TT owners could comment.

The TTram controller on the atari 4MB TTram board (TTFMCU U100) is an 84 pin
I/C the same I/C is used on the 4/16MB TTram board (ST-4115 Part Number
C300869-001). The 2/8Mb STram board uses the same 144 pin I/C as on the
TT motherboard (MCU U206) (ST-4133-E Part Number C301225-001).

All are custom MMU for atari, The GE Soft TTram board uses the small Xlinix
I/Cs so it should be possible.

3053. ROMS and Natural languages

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-25 00:00:00 UTC
From: A.I.Nicholls@herts.ac.uk
Message-ID: <423330153fa5@m18.herts.ac.uk>
Source record: 25322
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech

Does anyone know how to get the language the ROM is in on ALL TOS Roms. (I know about the cookie jar ones from Rainbow TOS)..

the ox_conf variable in the os_base as pointed out in the Atari User documentation says that will do it, but that comes out with a value of 255 (which as I understand can't be right..)

The programme profile comes up with the same result..

Alex Nicholls

3054. Transformer spec?

Newsgroup: comp.sys.atari.st.tech

Hi

I'm posting on a freind's behalf - he's just bought a 1040ST (I think!) with a distinct lack of power. As far as we can see the problem is the mains transformer but before going any further we need to know the basic spec of it. Can anyone help, or is it a special jobbie that Atari will charge us the earth to replace?

Thanx in advance

Steve

There is a text file on a.a.u.e that gives a nearly complete map of the
ST's memory I think it's called hardware.txt.

AFAIR it's the Glue that decodes the I/O & generates Bus errors.

> BTW, if anyone has done something like this I would be very interested
> in hearing about your modification.

Again, there is a file on a.a.u.e which gives detals on how to add TOS
2.06 to an STFM & it shows how to decode signals for chip select,etc.

AFAIR, a guy called Ted Rossin (who may have left the Atari scene) developed a way to put I/O devices above the 4 meg limit. Maybe somebody knows where he can be contacted or if he might be persuaded to post the files.

AFAIK the DTACK signal is monitored by the Glue; during a data transfer, if it does not get DTACK asserted within a certain amount of bus cycles, it generates an error.

The DTACK signal is inputted to the M68000 & is a wired OR bus, so if your extra hardware is addressed & selected correctly, it must be able to generate the DTACK signal. This should be enough to get above the 4 meg limit.

3057. Homebrew TT Ram ???

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-25 00:00:00 UTC
From: bericd@bri.hp.com
Message-ID: <DC9nsv.7ID@bri.hp.com>
Source record: 25326

Hi All,

I have a PAK board in my ST and was wandering about a Fast Ram board, but the price of these does seem a bit high.

What I was thinking was is it just a case of making the Ram appear in the memory map at the correct location (01000000h) and allowing the TOS 3.06 on the board to detect it up automatically on boot up?

I have 4 1Meg simms to use (From my previous RAM expansion board) and the necessary Flat_memory_map to DRAM address decoder should be easy and cheap to build up.

Whilst I am on the subject does anyone know of an easy way of generating the column and row strobe signals from the 68030's single address strobe?

Has anyone else thought about (or done) anything like this?

Cheers,

Beric..

From: fsctc@lerc.nasa.gov
Message-ID: <3v4d35$6jq@flame.lerc.nasa.gov>
Source record: 25327

I have a Mega ST with a tweety board installed. There's something wrong with the installation because there's no sound coming out of the speaker of my mono monitor. (Is it supposed to?) I don't think it's completely dead because I can still hear a very faint click as I type when all the kids have gone to bed. I didn't do the installation, so I don't know how to fix it. Does anyone here have a Tweety board instruction that you can send me to help me fix the sound?

There is a special value which means 'support all languages' which I
understand is used in the Falcon ROMs.

The patch worked fine. Thanks MH. There is, however, one problem
remaining with "flock". In order to lock an existing file it _must_
be opened O_RDWR. This means that files with mode 440, the norm in
my case, cannot be locked. Is this a feature with hairy legs and
antennae ;-), or can we expect a patch for that too -it's no big
shakes, I can easily work round it.
BTW, what is "lockf"? I have no man pages for these calls.
FreeMiNT 1.12.4 is looking good now.
Regards.

I'm fairly sure the Gemulator will do what you want (assuming Neochrome
is compatible with it). Also you may well find a Gemulator a useful bit
of kit to have (I'd buy one if I didn't have a TT as well as my PC).

However your best bet is probably to convert the NEO files to GIF or
TIFF using an Atari package - and then use PC software to access them on
the PC. There is no problem with transfering them across - as the PC should
be able to read write Atari 720K disks. Alternatively format disks to 720k
on the PC, and the Atari almost certainly will have no problems with them.

:-)

Roland.

The value in the os_conf byte in the OS header needs to be interpreted as
two separate values : the top seven bits give the country number, whereas
the bottom bit gives the PAL/NTSC flag.

As such, the value 255 says : country is 127, PAL.

Country 127 means "All countries/languages supported". The only TOS
version(s) with this info in it are TOS 4.x in the Falcon.

Previous versions of TOS are country/language dependent.

3074. GEMulator Question...

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-27 00:00:00 UTC
From: glupien@cyber1.servtech.com
Message-ID: <3v87dh$no2@murphy.servtech.com>
Source record: 25143

Has anyone purchased the GEMulator? Supposedly it emulateds ST and STe machines and uses TOS 3.09 or something under Windows 95 or Windows with 32bit extensions. If anyone has:

How well does it emulate? Do you get all resolutions? How about sound?
Does it use the floppy drives of your PC to read Atari disks diretly? Does it use your hard disk? What cand't it use?
Can it use all of your system memory or does it have it's own memory on board?
Is it an actual ST type machine on a card or is it software emulation with a little bit of assist?

How fast does it run and is the speed dependent on the processor in your P?

I'm thinking of getting one and I would like to hear about it first... THANKS!

- Gordon Lupien

3075. RGB monitor on a TT

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-27 00:00:00 UTC
From: leo@ahwau.ahold.nl
Message-ID: <DCDx98.35w@ahwau.ahold.nl>
Source record: 25144

Hi,

I was wondering if it is possible to use an RGB monitor on the TT to display TT-HIGH mode. Has anybody done this? The monitor should be able to display the resolution. The doc's talk about 1024*9xx. It's just that I have no idea how to connect the balanced output.

Leo.

3076. ATARI 520ST/midi - NEED HELP

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-27 00:00:00 UTC
From: edjey@aol.com
Message-ID: <3v8iab$4p4@newsbf02.news.aol.com>
Source record: 25145

Hi all:

I'm trying to hook up my OLLLLDDD Atari 520ST (with 1MB) to my Mac via midi only ... bought the Atari in '85 - it's a great little computer AND I wrote quite a bit of music using the PRO 24.3 software... I got most of it transferred even though timing's not perfect AND I forgot how I did it ...exactly...ARRGGHH... but I'm trying again and here's the problem...

The SF354 floppy disk drive seems to work... ie. I load the Language disk in it.. I get the Desktop up ok.. HOWEVER, it's slow and the red light seems to stay on a long time (ie. the busy signal) ... I may have messed up when I ejected the disk anyway and tried other floppies... The error message I got even from the first was/is:

"? Drive A: is not responding, Please check the disk drive, and insert a disk. If it is a hard disk, check it's connections"... I've checked power supplies, connections, etc. all appear to be in order... is it just some stupid thing I did.. or ... SIGH.... is it the drive itself ? If you think it's the drive.. do you think I could get it fixed somehow ?? SIGH again...

I'd really appreciate your input on this.. thank you..

Edjey

Yes. Digidesign makes one called Sample Cell which plugs into NU-BUS.
It is just amazing, together with editting softwares. This is what
Falcon lucks.
>
>6. Should I buy Mac or Atari ?!?

I am using both for MIDI and HD recording. Both machines has good points
and bad points. I prefer Ataris for MIDI sequencing, for it's groovy timing.
For heavy HD recording stuff, get a fast mac. If you have enough money
to spend.

I found a program on an Atari ST User mag cover disk, called Video Supreme. The ad goes something like this, "Using Video Supreme, you can add...text and graphics sequences as well as digitised sound samples..." It's a self-extracting archive file (it's a demo, by the way). I haven't played around with it, but it might be what you're looking for. If that sounds interesting, send me e-mail and I can send it to you as an attachment. You have to somehow connect the ST and a TV. I can read up and send you a review if that sounds interesting.

Good luck!

> the Sun's running 4.1.3 or whatever it's called..

Specifically for MiNT on Atari, but am I missing something?? Are not
Un*x type man pages just man pages which explain what the calls do
and how to invoke them? I thought that the whole idea was that Un*x
stuff did much the same whether it was run on a Cray or a ZX81.
Anyway a noble chap called Adian has fired me down the Sun ones
which explain fine what I needed to know (or most of it). These Sun pages
look mighty like the Mint ones I have here in format and in content.

>CD drive, orwould I still need another SCSI adaptor of some sort. I have a second
>MICRO Host adaptor if that could be used?

You could try to daisy-chain the SCSI out from the ICD to the CDROM. I've
never tried this as it involves a lot more soldering than I can
justifiably do. It would be too expensive. But IIRC you *cannot*
daisy-chain the DMA cable to 2 hostadapters (not to this type, ICD Micro)
The problem, however, is that this (older) hostadapter probably won't
recognize the CD-ROM drive. Most hostadapters have this problem, though.
I tried to connect an Apple CD-300 through an ICD ADSCSI and couldn't get
it working OK. Be advised that the ICD micro is somewhat limited: for
instance it will only recognize SCSI ID's 0-3. Maybe there are other
problems with it too. Remember that it was conceived for *one* internal
drive...

From: michael grove <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DCF7u6.9xx@ridgecrest.ca.us>
Source record: 25154

I talked to Steve Cohen of Wizztronics on 7/26. He stated that the Barracuda 040 is now on the back-burner:(. However, he did say that they will be releasing an 030 card simular to the 'Cuda in 12 weeks.
There are a lot of technical details, and I would have trouble getting them all correct. To be short, 48Mhz, accerlerated video, 32 bit memory, room for fast ram (no extra card needed) and Video Funnel port. Mabey someone with more knowledge on the subject might follow-up on this post.

Mike

Yes, but a few conditions have to be met. I'm working on the whole thing
and when I'm done I'll be documenting it with text and images for
uploading on the net. I'm already using a SONY HD drisk drive successfully
as a 720K drive now, I'm working on the electronic circuits though...
Stay tuned...

>Has anyone purchased the GEMulator? Supposedly it emulateds ST and STe
>machines and uses TOS 3.09 or something under Windows 95 or Windows with
>32bit extensions. If anyone has:

I have both gemulator 3 & 4.

Gemulator 4 is the latest and emulate STE & ST, while Gemulator 3 only ST. I guess what you heard is Gemulator 4 which runs under windows with 32 bit extension or Win95 (possibly NT & Wrap/os2 but I read from someone that it run flaky on OS2). It uses tos 2.06 (ST/STE compatible tos only).

> How well does it emulate? Do you get all resolutions? How about
>sound?
> Does it use the floppy drives of your PC to read Atari disks
>diretly? Does it use your hard disk? What cand't it use?

I haven't tried it much, installed it, tried out the benchmark software on it. It was too slow for me so I am back on my ST :-). Didn't use it for anything at all.

As for Gemulator 3, it's faster (dialog redraws are almost as fast as ST on 486DX33), but it uses virtual HDD, which are large files on your HDD. I compiled some of my programs on using ver 3, and it was stable. Fast & stable, so it's much better than 4 (this is my opinion only, don't quote me!!).

With Gemulator 4, you get all ST resolution plus more (VGA 16 colours etc). And support stereo sound if you have a sound card in your PC.

Gemulator 4 uses HDD directly, access any drive that are connected to you system including CD drive and network drive (OK, I haven't tried network drive as I do not have a network at home).

> Can it use all of your system memory or does it have it's own memory
>on board?

Uses PC memory... both pysical and virtual (so you gets 14 Meg max)

> Is it an actual ST type machine on a card or is it software
>emulation with a little bit of assist?

It's software emulation but loads tos from ROM which are housed in a Gemulator board. Takes up 1 slot in your PC.

> How fast does it run and is the speed dependent on the processor in
>your P?

I run on a 486DX33... quickindex dialog are 60% with NVDI. Without, it's only 30%. Also my SVGA board is 32bit, so it is fast under normal windows but not so with Gemulator (dunno why). Pentium 90/120 will be much faster, so I may need to upgrade to a faster system for it (like any other win32 software, needs more horsepower & memory).

Currently, I plan to use the older ver 3, but when I get enough cash and upgrade to Pentium, then ver 4 should be good.

> I'm thinking of getting one and I would like to hear about
>it first... THANKS!

Have you tried http://www.halcyon.com/brasoft/ ? That's the Branch Always Software Home Page. Tell's you all about the capabilities and more.

HTH

I installed mint/x/etc from the TAF distribution and it
appears to work but I can't get the TT to book into
ST-high resolution... I remember reading in this group
long ago about some key combination at boot-up which
will chose a resolution but cannot find the message
or anything about this in either the TT manual or
the Atari compendium. Any hints?? Thanks!

From: fs817@cleveland.Freenet.Edu
Message-ID: <3v9jc6$rd3@usenet.INS.CWRU.Edu>
Source record: 25166

Hi,

I am seeking an interface card for an Okidata 20 to make it
compatible with my 1040ST. Can anyone help me find
the interface card that I seek?

Thanks in advance,

--Rich

3098. Re: Sluggish V34 Modem?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-28 00:00:00 UTC
From: Dave Brook <Dave@mbha.demon.co.uk>
Message-ID: <806918029snz@mbha.demon.co.uk>
Source record: 25167

Grrrrrrrrrr :-(

I have a persistent problem using CoNnect and USR Courier. Particularly
when dialling overseas (European/American) boards, the display freezes
for some seconds. Sometimes the RZ light continues to flash so I suppose it
is a CoNnect problem not a line problem, also it doesn't happen with
Starcall (but CoNnect is a better program for me so I want to see if I can
fix it).

It seems to happen at all speeds (I have tried 9600,14400,28800), and
happens more frequently when the port buffer is set very low (eg 256 bytes).
Less when the buffer is set higher (eg 32k). Sometimes it freezes every 15
or 20 seconds Grrrrrrr! It does seem to be a setup problem...

I am using HSmodem4 with CoNnect set at port speed 38400.

Can anyone out there suggest what might be a solution? Thanks in advance...

3099. Wanted: ST I/O card for home automation

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-28 00:00:00 UTC
From: "M.Simons" <SBY3MS@RULSFB.LEIDENUNIV.NL>
Message-ID: <3va0sq$8ec@highway.LeidenUniv.nl>
Source record: 25168

My 2.5 Mb 1040 ST with HD and laserprinter is covered with a thick layer
of dust.
As a loyal Atari client, started with a 600XL and a tape recorder, I
had to switch to MsDos because of obvious reasons. Tramiel could have
done better.
On this matter, I'm lazy as I haven't searched any Atari stuff for 4-5
years......

Now I'm making plans to do some home automation projects. For MsDos-like
machines, the most fantastic and affordable I/O cards are available.

Does anyone know the use of such a card for Atari ? I would like at least
the following specs.:

- 32 or 64 input/output (1/0)
- some A/D (8 bit is sufficient)
- some D/A (" " " ")
- RTC on board ?

Has anyone experience with an ST running 365*24 hours a year?

Maybe one of you out there can help me ?

Regards,

Marco Simons

at&v does nothing on robotics. I think this should do. I really would be
pleased if someone could crack this one for me. I can fire you up the tech
spec for the modem if it will be of any assistance.

Apologies to any other users if they think this posting too long and best
handled by email, but I thought others may find this discussion
of interest if they are experiencing similar problems.

3101. HOT ATARI !

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-28 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <07281995.221159@empyr.dircon.co.uk>
Source record: 25170

Ha ! and you thought I was revealing a new super ST or something ?

Sorry, just a query about my ST running hot !

I've recently upgraded to 4Mb using a Marpet XTRA-RAM deluxe board and 4 x 1Mb SIMMS. The heat coming from the power supply now is a bit worrying.

Are the original 2 x 512k banks of on-board DRAM still being powered, despite not being used ? If so, can I disconnect them to ease the load on the PSU ?

The only ports with nothing connected at the moment are the printer port and the cartridge ! Everything else is being used. (Part of my secret plan, to get *every* port in use on the ST :-)).

Anyway, I've heard that Atari PSUs are not the most robust of items, and wondered if fitting a small fan inside the case above the PSU would help, or would the extra current drawn defeat the object ?

In case the PSU dies suddenly in the next few days, what are the most common places for them to go ? I won't be able to ask here *after* it's gone ! :-)

Cheers,

Kev.

> something).
>
> It did work once! Honest!!
>
> Has anyone any ideas?

Yep, run HDUTIL.PRG (should have come with your ICD software), select CONFIG, then choose the ICDBOOT.SYS you are running (usually C:\ICDBOOT.SYS), then you should see at the bottom a row of SCSI ID's to be skipped. You will probably find that the RTC ID is selected to be skipped. Just reselect it and save. Incidentally, if you only have one drive, you can set it to skip ID's 1,2,3,4,5 and 7 (presuming your drive has ID 0 and the RTC is ID 6), and it will boot much faster as it will not bother trying to get a response from those ID's on startup.

Hope this helps.

3104. FITTING BLITTER IN STFM ?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-28 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <07281995.221240@empyr.dircon.co.uk>
Source record: 25173

Hi, I have just acquired a Blitter chip, and would like to install it in my STFM (Rev D board, 4Mb RAM).

There is no socket on the board (yet !), but that is easily solved.

What I need to know is...do I have to do anything else apart from put a socket in and plug the chip in ? Are there any solder jumpers that need resetting or anything like that ?

Many thanks in advance,

Kev.

3105. POWER SUPPLY RUNNING HOT

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-28 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <07281995.221241@empyr.dircon.co.uk>
Source record: 25174

Hi, after recently bringing my STFM up to 4Mb, the power supply is getting very hot. I also intend to add a Blitter chip soon, and this will put even more load on it.

Can anyone tell me :

1) Are the two internal memory banks still drawing power, after connecting R60, R61, R71 and R72 to +5v as per the Marpet Xtra-Ram upgrade instructions ? If so, will it be OK for me to cut the tracks supplying power to them, or is there an easier way like snipping a couple of resistors ?

2) If I fitted a small fan, like a 486 processor cooling fan, would the extra current this would draw actually create more heat than the fan would dissipate anyway ? In other words, would it be a self defeating exercise?

3) I understand that ST power supplies are not particularly robust, and that when they go, it is usually in the same places every time. If my ST dies, I won't be able to ask this question later as I have no other machine to send mail with, so...where do they normally go bad ?

Many thanks in advance,

Cheers,

Kev.

From: kevan@empyr.dircon.co.uk
Message-ID: <07281995.221242@empyr.dircon.co.uk>
Source record: 25175

Hi,

My Rodime RO3000T hard drive occasionally has a fit. It sounds very much like the heads are repeatedly parking or something like that. It makes a CLUNK,chk,CLUNK,chk,CLUNK noise and sometimes even turning it off and on again doesn't help.

I have also noticed that at other times it seems to be losing power to the drive motor as you can hear it spinning down and then kicking back in, then cutting out etc etc. I have had an oscilloscope on the power connector during both of these situations and there is no problem with the voltages going into the drive.

I know this one is a long shot, but...anyone have any ideas ?

Cheers,

Kev.

Source record: 25176

Hi.

Anyone know where I can get a Blitter chip socket ? I bought a 68 pin
PLCC socket, but when I tried to fit it, the pins didn't match the holes.
The one I got has the two rows of pins on each side - in line, one above
the other. The atari PCB has the rows staggered like this:

```
. . . . . .
. . . . . .
```

Any ideas ?

Cheers,

Kev.

If you have socketed video shifter and MMU the the Marpet Xtra RAM board is
the easiest way. Just plug in some second hand SIMMs!

AC> that, Soldier!!

Funny you should say that, Alasdair. I have exactly the same prob. and symptoms. When I asked about it the most common reply was that I must have installed it wrong or messed-up mint.cnf to exclude the line which execs ....\kbd. Well, I've re-installed twice and checked out mint.cnf and it still fails.

I guess our set-ups must be similar but a little out of the ordinary.

Do you have Magic? Which version? (mine is 2.01)

I ask because I found another prog. yesterday which is not at all happy with Magic 2.

SKM>of it. Can anyone help, or is it a special jobbie that Atari will charge us
SKM>the earth to replace?

The 1040s I know of have a switch-mode power supply. If those are dead, in
most cases the transformer is not the culprit. Often, the primary bridge
rectifier is dead, followed by bad primary transistors or bootstrap resistors.

If you do not even know what a SMPS is, then you should better not try fixing
it yourself - there are 320V DC on parts of the PCB, and if you fool around
with the regulator circuit, you can easily fry the attached computer.

AC> This is all the information I could drag out of the little devil.

Can't say I understood much in the diag. reports but I've a feeling that even though you connect at 28.8 this is prob a bit optimistic on line quality. All those "blers" you are getting probably represent re-tries which will really blag you average transfer rate.

You are up in the highlands somewhere, aren't you? Some of your BT wiring could be very antique.

If this is true then you may need to limit the modems max. DCE speed to something like 24k to avoid all those repeats. On a Zoltrix you would do ATN0 to switch off automode and set S37 to (errm .... lost the doc. but I think it is 18 or thereabouts!).

The MiNT library's flock() tries to apply a write lock to the file descriptor (it internally calls Fcntl(fd, {F_WRLCK}, F_SETLKW)), but MiNT won't allow write locks on files not opened for writing (and it is correct in doing so).

There is no easy way to circumvent this. I believe that the MiNT could be improved to call Fcntl(fd, {F_RDLOCK}, F_SETLKW) on flock(fd, LOCK_SH) and to call Fcntl(fd, {F_WRLCK}, F_SETLKW) on flock(fd, LOCK_EX); this is what the GNU C library does. (You could discuss this with the MiNT library maintainers at <mintlib@nasim.cube.net>.)

However, I don't know if this would fix your particular problem. You're probably best off using the library's fcntl() interface with a read lock in your application.

> BTW, what is "lockf"? I have no man pages for these calls.

Just another file locking interface, inherited from SystemV. This one internally also uses the Fcntl() system call in the same way flock() does (it also tries to apply write locks).

That sounds to me like characters are getting dropped and there are a lot of re-transmissions. If this is so, then you could probably (I don't have a Sportster 28.8, but I do have a Motorola Power 28.8) "lower" (lower is higher? :-)) your maximum connect rate to 26400 through some AT command. Otherwise, you're probably looking at having to upgrade your UART to something that can handle more.

Good luck ...

Could be just a dodgy power plug/socket - make sure they are well mated :)

OR the drive motor is on the way out. The noise you hear will be the heads parking when the controller detects the disc speed has dropped to a dangerous level (no Bernouilli effect).

3118. BLITTER CHIP SOCKETS

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-29 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <07291995.201644@empyr.dircon.co.uk>
Source record: 25187

Can anyone suggest a source for a 68 pin PLCC socket (for the Blitter chip) ?

I bought one, but the pins do not line up with the holes on the Atari board :-(The one I got had the two rows of pins down each side, in line with each other like this : . . . . . .
. . . . . .

What I need is one that has offset pins like this : . . . . . .
. . . . . .

Can anyone help please ?

If I can't find the correct socket, I have a funny feeling I am going to try wiring up 68 wires to the pins on the socket I have, not a pleasant thought !

Cheers,

Kev.

Close to the vacant socket area are two solder links W3 and W4. These
must be _unsoldered_ when you install your blitter.
You may have trouble getting the socket though. DON'T get the maplin
one, it won't fit, it has its pins opposed instead of staggered. Let
me know, please a) Where you got your socket, cos I need one too.
b) Where you tried, cos maybe I can help, but it means rumaging in
the attic.

> through some AT command. Otherwise, you're probably looking at having
> to upgrade your UART to something that can handle more.
>
Errors it certainly is, eg, this morning i retrieved a 200 K file and got
the following stats:

```
Chars Octets Blks Chars Octets Blks Blerrs
sent sent sent recd recd recd
---- ---- ---- ---- ---- ---- ----
10999 9034 2150 240062 235934 4095 765
```

at a thruput rate of 1.3K/sec. And that was UK xmission at 3 AM, so things
couldn't exactly have been buzzing with activity. Yes, I'm an insomniac.

I thought of limiting the connect rate but can't find an AT command to
do it, only set a specific rate. Then if the modem cant connect at that
rate it hangs up. I'll try reading the manual again. I knew where I stood
with my lovely supra 2400 box. It knew its place.

Has anyone got any modem test software, so that I can put someone else's
modem into remote loopback and see what happens? I am determined to get
to the bottom of this.

regards.

I just sorted this problem out. It's really very simple. My new modem is
FAULTY. Sorry for shouting. I just downloaded the tech reference from
robotics and it tells me that the modem self-corrects any errors on
local analogue loopback tests. You have to specifically switch off
error correction before doing the tests and hey-presto, my modem
reports more than 255 errors/second just going from its own transmitter
to its own receiver! This is just at 28800. 26400 reports slightly
less errors, and 24000 is error free. This explains exactly what I
have been experiencing. My god, what is the point in having a
loopback test that corrects its own errors, I ask you. When error
correction is off, the modem will not even connect to itself at 28800.
Many thanks to all who have helped me find the source of this problem.

kind regards to all.
Thread over and out.

Don't bother. It's a nightmare of a job, and you'll probably wind up
knackering the socket or motherboard or both. Believe me, I tried it.
I ended up desoldering a socket (no mean task in itself) from a
temporarily dead STF wot is now without an MMU (which is why I need a
socket too sometime).

Right, I've done my attic rummaging and found the catalogue I was
looking for.
Try: Cricklewood Electronics
40 Cricklewood Broadway
London NW2 3ET
Tel: 0181 452 0161 / 0181 450 0995
There part no was PLC68.
Now I got to tell you this catalogue is 3 years old, but I got the
correct PLCC there a few years ago. Let me know how you get on.

regards.

AC> No Magic in this humble abode. What is it BTW?

You must get one! It is primarily a multi-tasking OS but, in addition to this, it seems to speed up the ST by around 100%. I was quite amazed when I first installed it and now tend to run with it as standard.

AC> But I have found out

AC> Can anyone tell me anything about the `fastload bit' in TOS 1.4?

Ther may be some clue here as my Magic is configured to 'fastload'. This feature is flagged by a bit in the program file header and causes the OS to load the program without zeroing the remainder of store. There are SOME progs. which assume that any store they grab will contain zeroes and these will often fall on their faces if 'fastloaded'.

I don't think its possible.

The TT-Hi output is ECL not RGB for starters. Also a standard RGB monitor could not cope with the high scan rates. Its all driven by a 120Mhz clock AFAIK.

It *might* be possible to get a decent SVGA monitor to do it via some sort of adaptor box. There is an Eizo monitor available with this built in.

:-(

The ICD Link is the converter between the ASCI/DMA port on the back of an Atari ST(E)/TT to a SCSI connector. If you have a MFM<->SCSI converter already then you should be able to do the following:

Atari ASCI/DMA -> ICD host adaptor (link) -> SCSItoMFM -> MFM drive

Hope that helps,

:-)

3137. NVRAM not working

Date: 1995-07-31 00:00:00 UTC
From: richcsst@crash.cts.com
Message-ID: <DCKAoE.6KI@crash.cts.com>
Source record: 25106

Hey, I have a weird problem with my Falcon. The NVRAM is NOT changeable at all. I have tried every possible NVRAM program to change its defaults and my Falcon still boots in High-rez ST mode on both SVGA and SC1224 monitors. Also, changing other settings such as language and time/date formats are ignored.

What's the deal?? Which chip has the NVRAM? Is it within the COMBEL, VIDEL, or SDMA chips? Is it the chip next to the GALs? I would like to repair or replace the faulty chip/part if possible.

On the off chance could the NVRAM be contained within the keyboard processor? If so, then my problem is solved as I am using a 1040 keyboard.

Thanks for any help,

Rich

3138. Help needed with sick Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1995-07-31 00:00:00 UTC
From: pd@mole.bio.cam.ac.uk
Message-ID: <3viohb$4cn@lyra.csx.cam.ac.uk>
Source record: 25107

I need some help with my Falcon.
The problem is that when I switch on the power, the Atari symbol either doesn't appear (in which case all I get is a blank screen) or it appears very slowly and corrupted (there are lots of pixels in random positions on the screen) and then just hangs.

I had this problem once before but it disappeared all by itself. However this time it hasn't.

I thought it might be
a) overheating (it's around 30degrees C) because it is much hotter than it has been before...
b) something wrong with the memory because I can't think of anything else it might be....

It isn't the hard disk, floppy, monitor or blowup as it does the same thing with or without these.
I have also had a look at the board and chips but nothing looks out of the ordinary.

I hope it isn't the memory because that is expensive! :(
If it is overheating, what can I do about it? Will a fan next to the machine help?

Thanks for any help,
Phil

From: pearlmangj@aol.com
Message-ID: <3viusa$qbo@newsbf02.news.aol.com>
Source record: 25108

I didn't see any posts similar to this, so if this is the wrong place for my post, I apologize. (Where would be a better place to post this?)

I have a 1040ST with a color monitor and internal and external drives. I'd like to sell it.

Don't know whether any of you remember Antic and START magazines, but I bought the ST while a member of those editorial staffs. When I left Antic Publishing, I wasn't really able to use the ST much anymore. Everything's in fine condition.

Any ideas where to look for a buyer?

Thank you very much for any help.

Gregg Pearlman

Source record: 25110

> Yep, I have an idea. Do a backup and replace the sucker.

> I had a Rodime that was doing that. Until one day it would not boot-up at all.

Mine seems to be behaving itself for the moment ! I have advertised for a replacement drive as I intend to replace it anyway. I'm getting sick and tired of the bad sectors that *NONE* of my HD Utility programs can find !

I run ICD Cleanup on it and you can see it stopping at the bad ones, getting a 'SENSE' message and after a few retries (obviously an internittent bad sector), decides that it can read it after all and doesn't mark it bad :-(

Anyway, I've had enough of the damn thing. I want a new(ish) one !

Cheers,

Kev.

P.S. I haven't got any backups ! I can't do it, no, never..... I will NEVER back up to over 100 floppy disks. I'd rather stick my head in a bucket of cow shit than have to sit here for years swapping floppies !!

Well, that is exacly what PINHEAD does. Does your Magic mushroom
have a facility whereby you can specify a list of programs which
must _not_ be fast-loaded. PINHEAD does. So how do I set this fastload
bit then, huh? There must be some utility that wil go thru all your
progs and set the bit. Then unset the ones that dont like it.

regards.

Hello everybody !

I've got a question concerning my machine.

I've got a MEGA ST2 upgraded to 4mb.

I bought ot as it is second hand.

Now I removed the cover, because it started

quitting some time ago and I thought

of the old ATARI overheating problem.

Since I removed the cover it stopped quitting.

But as I removed the cover I discovered that

a component is missing which apparently had once

been part of the machine and was removed some time.

Since I know nothing of computer architecture

I don't know what this component does and why

it had been removed.

Maybe anybody could tell me?

I checked with a friend of mine who has also an

upgraded MEGA ST2, and in whose machine this

component is still present.

It is located at the front of the machine, it is the

second from left.

It's a seven pin component named 74LS11.

It houses three and-and circuits, as I learned from

an electronics catalogue.

If anybody has any information on that, please

respond directly to my e-mail adress.

Thanx a lot.

Sounds like the power supply has a loose connector where
it plugs into the main board. Check to see if the plug has been hot.

>> at say 26400 or 24000. When i say much slower I mean about about
>> 1 Kb/Sec as opposed to 2.3 - 2.7Kb/sec.

First, apologies for misattributing the quoted text in my first reply.

Second, I just had another thought on the problem. Do you have
hardware flow control enabled? If not, you might want to try enabling
it. You will need to set both the modem (with some AT command) and
the software for hardware (RTS/CTS) handshaking. The system on the
other end is probably already using it (I think it would be crazy not
to use it at 28.8K.)

Hope that or my previous response helps ...

From: fluke@MCS.COM
Message-ID: <3vjmg4$243@Venus.mcs.com>
Source record: 25121

I have just spent several weeks recasing my Falcon in a tower case, so that I might have more room for drives, and a more "Manly" power supply for when/if I get an accelerator. I am courious to know the different models, and which ones people recommend.
One of the ones which I have heard about is the Barracuda, I think, which provides a 40 mhz 040(I think) and, more notably, the ability to expand memory in decent incriments.. 8 megs via 1 meg simms is what I am looking for, as it is a bit less insane than the atari 1,4,14 meg expansion limitation. Has anyone used these accelerators? Am I even thinking of the right one? What do you think of them? What are my other choices?

Thanks in advance,
Greg Linder

What the heck is a "knezjebjoarg"??????? You know, a "keyboard" in the
English speaking world (including but not limited to the UK, USA, Canada,
Australia, New Zealand and parts of Africa) is called a "keyboard". I am
more than grateful for your suggestions on my dilema, but please, to
avoid confusion, explain in terms of the language the request was written
in 8-).

If it's some sort of internal Finnish joke, then please enlighten me so I
may giggle with the rest :-).

Thanks, so much,

Rich

3160. Switching int. floppy problem

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-01 00:00:00 UTC
From: gio@wcl-rs.bham.ac.uk
Message-ID: <3vl6tl$igb@sun4.bham.ac.uk>
Source record: 25129

I'm having a problem replacing my internal floppy drive.

I've got hold of a 720k drive, but TOS doesn't recognise its presence, despite the fact that the drive seems to spin on power-up as per the usual sequence. The two drives are as follows:

Old: Epson SMD 480 L
New: Epson SMD 380

The only obvious difference between the two drives is the the 380 has a set of pins with a single jump lead between two of them. I've tried a number of other positions for this, but invariably the drive doesn't even seem to power-up for any position ber the one it arrived in.

Any ideas? Solutions? All comments gratefully received.

Be seeing you...

3161. Re: Identification unavailable (AHDI 6.061)

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-01 00:00:00 UTC
From: Claus Brod <clausb>
Message-ID: <3vlfud$qps@hpscit.sc.hp.com>
Source record: 25130

AHDI 6.061 tries to identify each drive on the ACSI bus by sending
the INQUIRE command. The Megafile 30 does not support this command,
so AHDI prints a warning message ("Identification unavailable").
While this may be confusing, it is not really a problem.

BTW, with your configuration, there's no real advantage in using
AHDI 6.061 rather than AHDI 3.0. Well, maybe the new version is a
little faster than the notoriously slow old versions, but I never
tested that. And if you need more speed in disk access, you should
rather update your TOS ROMs. TOS 1.02 is awful for any kind of
hard disk access.

Eh? What sort of place is it?

Better you put them in. The Tr*m*l bros would not have wasted £0.06
per Atari without good reason.
Send me yr snail address and I will bung you up the ressies.

Hi there!

I have a sort of simple question (if you know the answer that is B-)):

What do I need to setup Mintnet properly, so I can use it to call into
an Internet account properly?
i don't use MiNT normally, so any help would be appreciated
(ps. I have a runnable MiNT 1.08 and Minix partition)

btw: I tried but it just didn't work (am I studpid? <--no replies on this
grin))

3164. TAF X11/Chimera: Questions

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-01 00:00:00 UTC
From: avg@cwi.nl
Message-ID: <avg.807307554@news.cwi.nl>
Source record: 25133

I checked out the TAF X11 distribution, and yes, it is very good!
Apart from a few typical Atari flaws, it really works, and it is
not difficult to install (with some knowledge of UNIX).

Now I'm still stuck with a number of small problems, and I wonder
whether someone has fixed some of them before.

1. Warning: color name "black" is not defined. Many things appear
in white on white. Can this be fixed, other than by
explicitly setting colours to #000000?

2. A fixed serial connection at 115200bps does not work. Actually
HSmodem seems to blow serial port communication altogether.
I run the HSmodem drivers just before MiNT in the auto folder.
Even if I select 19200 (afwul for an X display connection...)
it refuses to communicate.

3. Keys don't repeat, even after 'xset -r on'. Don't tell me key
repeat is `not yet implemented'. Please.

3165. Floppy upgrade, 1040 STe

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-01 00:00:00 UTC
From: rbmier@winternet.com
Message-ID: <3vmdru$5ru@blackice.winternet.com>
Source record: 25134

Is anyone familiar with upgrading STfm/STe's 720K floppy to
1.44???? I've read and gone over many articles and come up with my
own version of how to do it. I have a couple questions.
All of the upgrades I've seen use a 74x157 multiplexer.
Will it make any difference if I use a 74x158 (same as 74x157 except
the output is inverted). This would invert the polarity of the 8/16 MHz
output in respect to the main clock.
I plan to AND the HD signal from the floppy connector pin 2
with D0SEL and use the output (LOW) to select the 16 MHz clock thru
the 74x158. I need to know if D0SEL is active LOW or HIGH.
(Hopefully LOW). The Atari Schematics I'm using don't indicate any
active states of the signals.

Thanks in advance. Post here or EMail is fine.

B>ICD bug from what I have heard on the net. Wayne

There was a bug in some earlier versions of the falcon HDX when partitioning
disks - if you used that for partitioning your disk, you may garble your data
no matter what driver you are using now - and it may happen again if you fill
up the partition up to the limit.

When you exit NOS (type exit at the NET prompt) you are returned to
OASIS which then unbatches any news you have received ready for reading.

3169. booting problem with AHDI 6.061

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-02 00:00:00 UTC
From: WOESLE@rzmain.rz.uni-ulm.de
Message-ID: <3vnvb6$e58@waage.rz.uni-ulm.de>
Source record: 24993

Hello,

recently I have updated AHDI 3.0 to AHDI 6.061 on my Megafile 30. With this driver booting takes more than a minute and I get the messages "UNIT 0 - IDENTIFICATION UNAVAILABLE" und "UNIT 1 - IDENTIFICATION UNAVAILABLE".

Additionally none of the AUTO-Folder programs was started.

I hope that anyone can help me to solve this problem.

Thanks in advance

My configuration: Mega ST2, TOS 1.02; 2 Megafile 30 (units 0 and 1); MagiC 2.0.

I hope that anyaone can help me to solve these problems.

Thanks in advance
Berthold

3177. PLIP between Linux PC and MiNTnet

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-03 00:00:00 UTC
From: bjb@praxis.co.uk
Message-ID: <3vq0n1$hlv@skolem.praxis.co.uk>
Source record: 24996

Has anyone compiled in MiNTnet compataible PLIP support to Linux for PCs? I know very little about PLIP and PC hardware so I can't do it myself but it would be really useful if I could use a PLIP connection between my Linux PC and my ST as that would free up the serial port on the PC (yes there's only one ;-) for mouse or modem, and give me much better transfer rates at the same time.

From: zragr01@aixpanic.zdv.uni-tuebingen.de
Message-ID: <3vqjjj$gui@newsserv.zdv.uni-tuebingen.de>
Source record: 24997

Hi everybody!

I own a SLM804 Laser-Printer and it's doing a fine job for years, but
from one sheet of paper to another it started to drop tons of toner
on the sheets, and as result they're coming out almost black. :(
I cleaned the whole printer twice, but the problem remains. :(:(
I've no idea, where to look for the problem. The mechanics are working
fine, the paper is transported well, the printing mechanism is still
working (at the not-so-black-edges you can still see proper output),
so I guess it's no problem of the high-voltage or the electronics,
but WHAT CAN IT BE???
If anybody has an idea, a hint or a similar experience with HIS SLM804,
I'd be glad to hear from that person.

E-Mail: groeneveld@zdv.uni-tuebingen.de

Thanks in advance,

+ Heiko +

My friend bought Extendos Pro and then got a CD ROM drive at a swap meet.
Guess what.....:-(

The drive is properly terminated. He is using The Link 2.
The drive is a Media Vision CDR-H93MV. I personally think that the drive
is faulty. ICD PRO doesn't even see it as a SCSI device.

Ant ideas or is there an FAQ on the subject?
Thanks, Julian.

3180. inetd problem

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-03 00:00:00 UTC
From: thopman@uoguelph.ca
Message-ID: <3vqv9h$80a@ccshst05.cs.uoguelph.ca>
Source record: 24999

After reasonably successfully moving my MintOS/MintNET setup up from my Mega to my TT, I tried running it, and everything appears to be working fine, except for one (hopefully) small problem: after inetd is run from the standard (i.e. unchanged) MintOS scripts, it (or I think it's inetd) says that /pipe/log is not found. I didn't have this problem before, and now that I do, the MintX server is unable to bind UNIX sockets, and won't run. I haven't tried out PPP yet, but if the problem is with inetd, it probably won't work either.

Any suggestions?

Thanks...

Wizztronics is about to release the Hawk!

It is a plug in module for the Falcon 030.

System specifications:
- Plug and play design for ease of installation
- 128kb level 2 cache (256 optinal).
- 32 bit system RAM, made for plug and play with the
stock Atari Ram board, Supports 4/14 MB ram card or
72 pin SIMM modules.
- 32 Bit system ROM
- 32 Bit TT compatible Fast RAM, up to 64 MB using
standard 32 bit SIMMs. This is an Option!

Video
- Enhanced video capabilities (like blow up hard II)
some available resoiutions are 448x512 true color,
896x512 256 color, 1280x968 in 16,4,2 color modes
- Video accelerator, 1 MB (2MB option)

Expandablity
- Like The Baracuda 040...

Performance Factor
- 100 % Compatible!
- 16 Mips at 48MHz (Falcon 030 3-4 Mips)
- 400-500% faster than a standard Falcon 030
- Enhanced DMA access.
- 1 wait state ROM.
- 0-2 wait state System ROM.
- 0 wait state TT Fast RAM.

Price:
MSRP 725.00 USD!

NICE.........:-))

3183. SETUP won't run on my TAF mint etc disks, what's wrong?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-03 00:00:00 UTC
From: jason@whatnext.demon.co.uk
Message-ID: <807484266.29564@whatnext.demon.co.uk>
Source record: 25002

I recently downloaded the TAF disks from hensa and tried to install
(as 7 disks) onto a TT. (4+4 mem/120 hd)

On initial booting the fast modem routines load, followed by MH-MiNT,
mintnet, interfaces and Minix FS. The screen displays 'TURBO mode',
'Now booting MiNT' then the # sign. So far so good.

Trouble is, that's as far as I get. On typing 'setup f' and other
combinations I get 'path not found' and consequently haven't yet got
to install disks 2 to 5.

As far as I can see I've followed install.txt except I used stzip.prg
(not the .ttp) and I don't currently use a bootmanager. I haven't yet
got to the bit about editng the mint.cfg file...

Can anyone tell me what I'm doing wrong, or not doing etc.?

A standard green screen composite monitor is unlikely to run at much above
60Htz. You need about 71/72ish for a ST-Hi mode.

Its not doable AFAIK. Best place to start if you want to go DIY is with
a old mono VGA screen. These can cope - and with a little bit of internal
tweaking apparently work fine.

All IMHO and AFAIK. I've not done this myself.

:-)

Roland.

Julian,

You ddin't mention if your friend has any other SCSI devices connected. Also most of the SCSI CD-Drives out there will work with the Atari.

does the drive have a self-test mode?.

3188. IDE on Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-03 00:00:00 UTC
From: Jinlung Fung <emperor+@CMU.EDU>
Message-ID: <Ik8Cpwe00YUqE_Q2Jw@andrew.cmu.edu>
Source record: 25007

I am trying to connect a regular IDE drive (3.5" 40pin connector) to the internal IDE port on the Falcon. However, the connector inside the Falcon is a 44-pin mini IDS connector. Does anyone know what I should do to connect the IDE drive up? Also, where should I tap the power from?

Ta Ta For Now,
Michael Fung

>not to be the case! Is this true?

Yep it's very hard to make an ordinary monitor do ST Hi-res
the scan rates are so much faster. requiring major surgery to
the monitors line and field circuits and it's unlikely the line
transformer could stand the pace (the one I tried worked for
about an hour before going POP!!)

>in 4.03 or 4.04 but i think it has been fixed. I don't think its an
>ICD bug from what I have heard on the net.

Yep it's a Falcon bug and I think it was fixed in later versions of ICD
driver - I presume they do a check to see if the cluster is past the end
of the partition, I suppose they used leave it to TOS to do the checking....

The obvious answer to this bug is to leave a couple of sectors not
allocated at the end of each partition when you format the drive
4 for 1024 byte cluster size 8 for 2048 .....etc
24Kbytes is not a lot of wasted disk space even on 20Mb drive

has anyone ever used a 19" monitor on a falcon?
is there any 19" that support both color and mono?
please let me know..

does a Moniterm work on a falcon?
can the falcon be modified to make it work?

how about the atari tt194 (i think this is the model number of this)
anyone know how much they go for and if they will work?

thank you

SAK L.J. (L.J.Sak@kub.nl) wrote:
: What do I need to setup Mintnet properly, so I can use it to call into
: an Internet account properly?
: i don't use MiNT normally, so any help would be appreciated
: (ps. I have a runnable MiNT 1.08 and Minix partition)

If you have MiNT and a minix partition already, you are part of the way there! I take it you have also got a copy of MintNET and have put the .xif and .xdd files in your c:\mint directory? You should see the console messages telling you that they are loaded when you reboot. Other packages you will need are :

ping - test connectivity (ping 127.0.0.1, ping 128.240.3.15)
telnet - telnet to (almost) any machine on the 'Net
rlogin - rlogin to *nix machines
ftp - transfer files

Not completely essential, but useful are :

nslookup - test/navigate DNS lookup
traceroute - find out packet routes to other hosts
rdate - synchronise time with a time server
rcp - rcp to/from *nix machines
rsh - rsh commands on *nix machines

I use the rc scripts from mintos and use its init program. I found this the easiest way to put the relevant programs in the correct places and /etc/rc.* scripts to mangle for myself. The programs you need to run are :

syslog (optional)
ifconfig lo0 addr 127.0.0.1 up

At this point, you should be able to ping 127.0.0.1 - loopback interface and verify that MintNET is working. For more functionality, add :

/etc/hosts - IP address / host information
/etc/resolv.conf - and
/etc/host.conf - DNS resolver - supercedes /etc/hosts to some extent

Connecting to your provider depends on the service they offer - probably SLIP or PPP. My inclination would be to go for PPP - it's a newer `better' protocol. For this, I used the ppp-2.1.2 package. The chat scripts are a bit of a pain to set up (i.e. about 15 phone calls and 2 evenings for me:), but you only have to do it once. If you only have the choice of SLIP, people use dip (dip-3.3.7uri ?), but I haven't tried it. After you have SLIP/PPP working, you should be able to use telnet/ftp/ping/whatever to contact other machines on the 'Net.

If you want to be able to rlogin/telnet/etc to your machine, you will need to get :

inetd - manages incoming connections
telnetd - for incoming telnet
rlogind - for incoming rlogin
ftpd - for incoming ftp
rshd - for incoming rsh/rcp

One thing that I haven't mentioned so far is that the programs are all text based - either run a shell as the INIT from mint.cnf, or use something like Toswin to get a command line prompt.

I've probably missed several things out, but hopefully I've got the major points.

J

PS. If you run init, the rc file defaults to deleting the contents of /tmp! Don't run plip.xif if you have a parallel printer attached.

The good Kay Roemer fixed this one for me. The syslogd takes about 3
seconds to set up the /pipe/log file. Presumably your TT is faster than
your Mega and needs the logging before things are ready. Move the startup
of syslogd further up your start-up script or simply add a "sleep 3"
after starting syslogd. Your problem will vanish.
regards.

Hi there!

I installed the Chimera this week. The only thing I had problem with was
the PPP stuff - For this I guess that you have to sit a while, testing
connection by using tcsh (SHELL) and manually type in what's written in the
chatfile and ppp144 files.

About your problem:

I guess you only have one single partition on your harddisk and that is
the partition C: (SCSI id:0).

You must have, at least, one more partition, say 'd'. Then you type
'setup d' instead of typing 'setup f'. I know that it works with
another partition than f because I use partition g (a totally separate
harddisk than the builtin one) for the Chimera disks.

Warning: DO NOT USE PARTITION C: WHEN INSTALLING !!

The reason for needing another FREE partition is that it will be
formatted as a MINIX file system and the layout of that one is
UNIX-like (not MSDOS-like as the TOS file system).

To create another partition, save all your C: stuff on disks (or
on some other harddisk, or buy another harddisk and set it up as
SCSI id: 1. Then it will be named partition D:). If you choose
not to buy but to save on disks, then: Repartition your 120 MB
HD into two partitions using the HDX program (shipped with
your TT030) - look in the TT-manual how to do it. After that
is done, boot the TT with your boot disk and copy over all disk-
saved files to the C: partition of your now double-partitioned
HD. After all this, you can use the D: partition for the Chimera
disks. Puuuhh...

More information:

In contrast of what they say in the install.txt, IT IS POSSIBLE
TO COPY FILES between TOS and MINIX partitions when using the

"normal" GEM desktop. To be able to do this, you must have a
pre-installed 'normal' MiNT environment installed on the C:
drive. Then use your normal mint.cnf and replace the mint.prg
(in the AUTO folder) with the one shipped with the Chimera disks.

You must type 'source setup f' not 'setup f'. That's what the instructions
say! (Otherwise, another shell will be spawned to try and run setup
but in the mode you're in there are no other shells to spawn)

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.transputer,alt.folklore.computers

Hi. I'm trying to get some information about an Atari
Transputer Workstation, model ATW800. It seems to date
from about 1990. It's in a large tower-style case.
On a cursory examination, it seems to contain most
of the innards of an ST, along with a large board
with a T800 transputer on it and another board that
seems to be a video card of some sort. All I've got
is the box and the keyboard; no monitor, no mouse,
no manuals. I'm told that it runs Helios.

Basically, I'm looking for any information about this
machine; in particular, I'd be very grateful for
pointers to any companies that might still be able
to supply documentation for the machine and its
software.

Thanks in advance,
James

3208. FAST Tape Drive and new Hard Disk

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-04 00:00:00 UTC
From: Paul Purdom <pwp@cs.indiana.edu>
Message-ID: <1995Aug5.033318.15786@news.cs.indiana.edu>
Source record: 25027

I have a FAST tape drive made by ICD. I also have a new 512 Meg hard drive formated with ICD software. I can not transfer information to or frm the tape drive with this set up. (The tape drive and disk are both fine.) Apparently the tape drive does not recognize the partitions on the hard drive. They all have the format that allows about 64 Meg in a partition.

I could just not use the tape drive.

I could reformat the disk to have some regular partitions and just use the tape drive on them. I would like to avoid that, however. (If I do do that, where on the disk drive is the ICD software. It is a later version that the other versions of their software I own.)

I am hoping ICD upgraded their tape software. Does anyone know if that is the case? Does anyone know whether ICD can be contacted by email? (I have their phone number. I also know that they are on Genie, but I am not.)

Thanks for any help you can provide.

3209. Re: Iomega Zip FAQ 1.5

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-05 00:00:00 UTC
From: schuster@panix.com
Message-ID: <3vvnhb$oqd@panix3.panix.com>

Since you asked for additional questions:

How are media defects handled? Does a formatted Zip disk ever return "bad sectors" to DOS? If not, does the formatted disk have spare sectors for silent replacement? How many? What happens when it runs out? Is write verifiction performed during i/o? What are Iomega's criteria for accepting a disk as defective uner warranty (relate to answers to above questions on defect handling).

You might also point out that, cabling difficulties aside, the SCSI Zip cannot be used **ALONE** with the Adaptec/Trantor MiniSCSI series of parallel-to-SCSI adaptors because they require TERMPOWER which, stupidly, the Zip drive does not provide. They will work, however, if (still further cabling difficulties aside) another SCSI device is in the daisy chain which does provide TERMPOWER.

Please consult the Iomega board press release for the Zip. It clearly states that higher capacity is merely a matter of media refinement...not of the electronic or mechanical aspects of the Zip.

The implication is that 200 mbyte disks are possible.

Now..since they are making huge sales of these things as is, I don't expect to see 200 meg disks for a long while (9 months to a year)..or earlier if they are threatened by another product.

Note that no one at IOMEGA will absolutely DENY the possibility of higher capacity disks for the Zip 100...however, it IS called the Zip 100.

Roger, I disagree. I doubt that you could merely stick a '200 meg
disk' into a zip drive and have it act as 200 megs... that'd be like
sticking a 2.88 meg floppy disk into a 1.44 and expecting it to
work...

At the very least, it would require a software rewrite, and PROBABLY a
firmware change in the zip drive... packing more data on the disk
would require actually putting the sectors closer together, which
would require the heads to move in completely different ways...

Besides, they've got the Jaz drive coming out in a few months, and
that'll wipe out ANY other removeable storage product, rewritable
optical, and Magneto-optical excluded.

This FAQ attempts to answer many common questions and clarify many
misconceptions about the Iomega Zip drive, one of the most innovative and
viable secondary storage and backup devices to come on to the Mac scene
in a very long time.

Additions, addendums, corrections, or further questions can be submitted
to steveg@phantom.com. In no way whatsoever am I to be held responsible
for errors or omissions in this FAQ that could lead to further
misconceptions, problems, data loss, conflicting issues or (for whatever
reasons) sudden death. Use this FAQ at your own risk.

MacUser (July 1995), 4.5 stars (5=top rating)
UK MacUser (June 9 1995), 5 stars (5=top rating)

This FAQ is posted on an as-needed and as-completed basis to the following Usenet newsgroups: comp.sys.mac.hardware.storage, comp.sys.ibm.pc.hardware.storage, comp.sys.atari.st.tech, comp.sys.atari.8bit, comp.sys.amiga.hardware. This FAQ will also be uploaded to the two most popular Macintosh ftp sites (sumex-aim.stanford.edu and mac.archive.umich.edu) for placement in whatever directory the supervisor(s) of those sites deem appropriate.

If you have a Zip-related question which you'd like to see directly addressed in this FAQ, please send mail to the appropriate users -- and PLEASE make sure you address them properly. While I can appreciate the need for answers to your PC-related questions, as a Macintosh enthusiast I (steveg@phantom.com) simply do not have the answers you seek, so PLEASE STOP MAILING ME with PC questions!

For Mac Q&A.....steveg@phantom.com
For PC Q&A.....lee@library.ucsb.edu (who will forward the answer to me for inclusion in the next edition of the FAQ)
For all other platforms...Until we get appropriate "Zip Gurus" on other platforms, post questions to your local usenet newsgroup(s) that relate to your platform.
- - - - -
***SECTION 2: GENERAL ZIP-RELATED ISSUES

Q1: What is the Zip drive?
A1: The Zip drive is a new drive from Iomega Corporation, makers of the Bernoulli line of removable storage devices (competing primarily with drives from the SyQuest corporation). The drive uses proprietary cartridges providing 100-MB unformatted storage capacity (25-MB cartridges are expected to be released soon). The drive was first

advertised in the catalog pages of MacWarehouse (a popular mail order company) several months before the drive began shipping. As a result, a huge backorder was created even before the first drives began trickling out. After the drives began shipping in earnest, other mail order companies and local retailers began advertising and selling them. Waiting periods ranged from a few days to over a month, depending on which vendor you ordered from and exactly when you ordered.
The drive itself is rather small (slightly larger than the typical Supra modem), and weighs less than one pound (including disk). The case is a cheap-feeling but reasonably sturdy dark blue plastic affair with six gray rubber feet attached, allowing the drive to be set flat (like a typical modem) or on edge. A green LED on the front of the drive indicates that the drive has power, while an orange LED next to it acts as a busy light. A small round gray button is set below the two LEDs and acts as an eject button. (When the drive is connected to the Mac, the disk is automatically ejected like a floppy disk when the disk icon is dragged to the trash can. If you have a disk installed and the computer is not turned on, pressing the button on the drive will eject the disk.) A clear plastic window is on the top of the drive allowing the user to see the label of an inserted disk. The back of the drive has two 25-pin SCSI connectors. Between the two connectors are two switches; one allows the user to set the drive between SCSI ID 5 and 6 (those are the only two options available), while the other provides termination (ON if the Zip is the last device on the SCSI chain, OFF if there are devices on either side of the SCSI chain). The power inlet is located on the side of the drive (on the same side that would face down if the drive were positioned on its side) and provides both a recessed power connector and a recessed power cable guide for aesthetically routing the power cord.
The drive uses regular magnetic-type read/write heads to store data; it is not a magneto-optical drive, removable hard drive, etc. The best way I can describe it is as "a 100-MB floppy drive that's about as fast as a hard drive."
The drive ships with an external two-prong power supply (which weighs slightly more than the drive itself!), one 100-MB "Zip Tools" cartridge containing many excellent utilities for formatting, indexing and backing up your data, two floppy disks for installation (one for Mac, one for PC), a thin but complete owner's manual, a shielded 25-to-25 pin SCSI cable, and the usual assortment of promotional goodies. Setting up the drive takes only a few minutes.

Q2: What's the deal with the cartridges?
A2: As of this writing, only 100-MB cartridges are shipping. Each cartridge has an unformatted capacity of 100-MB; after formatting, they provide about 95-MB of storage capacity. Cartridges cost between $15 and $25 apiece depending on vendor and quantity purchased. Each cartridge measures about 3.875" square and are about .25" thick. They come in a hard clear plastic fold-out case, similar to a magneto-optical disk. The cartridges are prelabeled; replacement labels are available from Iomega for a rather pricey $3 for a package of 10. Iomega plans to have 25-MB cartridges available soon. Cartridges can be formatted with just about

any low-level SCSI formatting utility, though no significant performance or capacity differences were noted between using the different formatting utilities. Programs such as TimesTwo for the Mac (by the now-defunct Golden Triangle) or Stacker for either the Mac or PC can be successfully used to format the disks to an artificial 200-MB each, but I wouldn't recommend it for several reasons. Besides, the cartridges are cheap enough to store data without compression.
Several people have reported that MS-DOS formatted Zip disks seem to be in more plentiful supply than Mac formatted Zip disks, presumably because the Zip drive isn't making as big a splash in the PC world since they have never had as strong a deficit of low-cost, high-capacity secondary storage devices that the Macintosh has had to suffer through. If you can find PC formatted Zip disks, snag 'em; they can be easily reformatted to work on the Mac. (And vice-versa, if the need is there.)

Q3: Can the Zip drive use other types of media?
A3: The Zip drive and its cartridges _are_not_compatible_ with any other media or drive. A Zip drive cannot read/write/format/recognize magneto-optical disks, floppy disks, SyQuest cartridges, Bernoulli cartridges, DATs (or other types of tape cartridges), or any other sort of non-Zip media.

Q4: How fast is the Zip drive?
A4: Like any SCSI device, overall performance will vary depending on what system and configuration is used. The shareware Macintosh benchmark utility Speedometer 4.0 gives the drive a rating of .794, which is slightly faster than the 44-MB SyQuest drive that I tested as a comparison device (and gave a rating of .736). This is fast enough to run most software; QuickTime movies run quite smoothly from Zip disks, as do sampled sounds and similar time-specific files. (See more detailed ratings at the bottom of this FAQ.)

Q5: Does the Zip drive use Bernoulli technology?
A5: No, not at all. The Zip drive is a sort of hybrid of modern drive assembly techniques and established Winchester-type drive mechanisms. The Bernoulli Effect, and the technology that Iomega applies to it, is not to be found in this drive.

Q6: It's such a new drive...How does it rate in terms of quality?
A6: Only time will tell for that, of course. It is my personal feeling, and the overwhelming feeling of most of the Zip owners on the internet, that the Zip drive is quite solid and reliable. I've personally put about six hundred consecutive hours of access time on my Zip drive and had nary a single problem. I've transported the drive in a plain plastic grocery bag to work and back (a half hour New York walk) and hadn't had a problem with it. The drive is tightly constructed, though some may think it feels cheap. My personal drive survived numerous leg-bumps while walking to and from work and survived without a single scratch or performance defect.

Q7: What if I want to buy one Zip drive for use on several different machines?
A7: If they're all Macs, you're set. Just install the Zip Tools software

on each machine and off you go. Of course, you'll need to physically move the Zip drive from one Mac to another as well. If you're dealing with a mixed Mac and PC environment, your options change. If your PC has a SCSI card you can plug the Zip drive into it, install the PC Zip Tools, and away you go. If you don't have a SCSI card on your PC, Iomega offers a ZIP SCSI adapter for $60 (Iomega part #10013). If you don't want SCSI on your PC, you can buy the parallel version of the Zip drive. It offers all the same features of the SCSI Zip drive, but it interfaces with the more common parallel connectors on PC's.
The hardware interface is easy; connect it as you would any other SCSI device. The potential problem lies in the Zip Tools software. Iomega only packages the Zip drive with Zip Tools for Mac and PC running Windows (they also offer the Zip Tools package for OS/2; this disk costs an additional $20 and is Iomega part #10045).

Q8: What other goodies are offered with Zip?
A8: A small color brochure is included with the drive selling such items as carrying cases, Zip disk holders, extra Zip disks (which are more expensive than mail order and some retail outlets), Zip disk labels, Zip SCSI cables, the aforementioned PowerBook adapter, power supplies, Zip SCSI cards, and Zip Tools for the three mentioned platforms. It is mentioned in the Zip documentation that a Zip drive cleaning kit is offered through Iomega; however, there is no evidence of this kit in the color brochure. (Note that the Zip drive CANNOT be cleaned with a conventional floppy drive cleaning kit, so don't try it!)

Q9: Any other things, good or bad, that I should know?
A9: There are some issues which some people find fault with which I'll point out here. First, the drive has no POWER switch. When the drive is plugged into an active electrical outlet, it's on; when it's unplugged, it's off. I personally have no problem with this as my drive is plugged into a switchable power station (Kensington MasterPiece Plus; no affiliation, though I think this is an excellent unit) and I can turn it off and on with the station's button.
The drive also has only two SCSI ID options (5 and 6), which means that if you have a relatively full SCSI chain, you may find yourself switching the ID's of other devices on the chain.
As was previously stated, the drive has two 25-pin SCSI connectors and ships with a 25-to-25 pin SCSI cable. For most users with multiple SCSI devices, this means that the Zip drive will be the first drive on the SCSI chain and other devices will plug into the Zip drive. If you happen to have a spare 50-to-25 pin SCSI cable, you can place the Zip drive on the end of the SCSI chain (thus eliminating the need for external terminators, since the Zip has switchable termination) by connecting the 50-pin end to your formerly-last SCSI device the the 25-pin end to the Zip drive. This is NOT to say that the Zip drive couldn't be placed in the middle of your SCSI chain. It certainly can; the only thing you'd need to accomplish this is the appropriate SCSI cables (25-to-25 and/or 25-to-50, depending on your other devices).
The drive is VERY quiet. For some, this is a blessing; for others, a curse. The drive makes a quiet (library-level) clicking sound as the

read/write heads move across the disk, but that's about it. Do not rely on auditory feedback to determine the status of the Zip drive. :-)
The drive also has a power saving mode. When the drive is not accessed for a few minutes, the drive kicks down into a low-power mode. When the drive needs to be accessed while in low-power mode, it only takes about a second for the drive to get back into action (considerably less time than it takes for a PowerBook's hard drive to spin back up).
When inserting a disk, there is no lengthily spin-up time like a SyQuest drive so the disk is almost instantly available. When a disk is ejected, there is no spin-down time so the disk ejects at least as fast (if not faster) than a floppy disk, and leaves the drive with a very solid and satisfying "ker-CHUNK" sound.

Q10: I want more information and, gee-golly-gosh-darn-it, this FAQ just isn't enough! How can I get in touch with the folks who make the Zip?
A10: It turns out that there's a whole lot of different ways you can contact Iomega. If you're still living in the Stone Age (or, perhaps more appropriately, the Stamp Age), you can write them: Iomega Corporate Office, Iomega Corporation, 1821 West Iomega Way, Roy, Utah 84067-9977, USA. The voice telephone number for their corporate offices is 801-778-1000, but DON'T call there unless absolutely necessary. Iomega has been smart enough to supply about half a dozen alternative telephone resources. An Interactive Voice Help system (24 hours) is available at 1-800-456-5522 (or 801-778-3000 if you're in the area code). Sales Information is at 1-800-MY-STUFF (1-800-697-8899). An automated FAX assistance system (US and Canada only; 24 hours) is at 801-778-5763. But wait! There's more! Iomega operates a BBS at 801-392-9819. They're on CompuServe (Mac users type "GO MACCVEN", PC users type "GO PCVENE") and America Online (keyword "IOMEGA"), and they have an internet email address at info@iomega.com. Finally (?), they operate a Web page at http://www.iomega.com/. Whew!
- - - - -
***SECTION 3: PORTABILITY CONCERNS

Q11: Is the Zip drive available with a power supply of 220/240 volts so that it will work in other countries?
A11: Yes and no. By itself, the Zip drive ships with a USA-standard power supply which can't be used everywhere around the world. However, Iomega sells a "Universal Power Supply" (item #10044) for $40 which, according to Iomega documentation is "smaller, lighter, and usable worldwide". I've received some reports from several people who state that this power supply works in several different countries. Zip owners in the USA who travel within the country with their Zip drive may want to consider this power supply as it is indeed smaller and lighter than the standard power supply (almost half the size, in fact) and would make portability that much easier.

Q12: Does that "Universal Power Supply" include all ten billion adapters to fit the various electrical outlets of the world?
A12: No. You get the small device pictured in the catalog as well as a standard computer peripheral power cable. If you want to plug it in

anywhere else in the world, you're on your own for adapters. (Radio Shack, among many other vendors, sells adapter plugs for various world ports.) This is not an Iomega part; you might be able to get it faster by ordering it from somewhere else (it is from Advanced Power Solutions and is model #SA-051A5F-10).
- - - - -
***SECTION 4: MACINTOSH ISSUES

Q13: Will the Zip drive work with System 7's virtual memory?
A13: Like all other removable storage devices, no, it will not work. It is my understanding, however, that other virtual memory programs exist which can use removable storage devices (and, as such, the Zip drive) as VM storage, but that's a subject for another FAQ. :-)

Q14: Can you boot a Mac from a Zip disk?
A14: Yes, you can. There are two ways to accomplish this. (The following instructions assume that you have a Zip disk with the proper System software installed on it.)
First, when the computer is up and running, insert a Zip disk. Open the "Startup Disk" control panel and select the Zip disk as your startup disk. While holding down the OPTION key, select RESTART from the SPECIAL menu; holding down OPTION prevents the Zip disk from being ejected. (If for some reason the Zip disk IS ejected after you select RESTART, simply reinsert the Zip disk BEFORE the "happy Mac" icon comes up and you'll be in business.)
The second way is a bit different and assumes that your computer is turned off, but the startup disk is the hard drive you usually boot from. Power up your Zip and insert the Zip disk. Boot your Mac while holding down the SHIFT, COMMAND, OPTION, and DELETE keys; this forces your Mac to bypass the internal hard drive and should cause your Mac to boot right from the Zip disk.

Q15: Will Zip work with a PowerBook?
A15: Absolutely! However, you'll need to invest in an HDI-SCSI adapter; Iomega sells this for $20 and is part #10042. Other manufacturers sell this type of adapter at comparable prices.
- - - - -
***SECTION 5: PC ISSUES

Q16: What's a Zip Drive-SCSI for PC?
A16: It's the same thing as a Zip drive for Mac. Depending on your SCSI interface, it should be about the same speed. Iomega sells an inexpensive ($54) SCSI card for the Zip drive called the Zip Zoom (see below). The software for both Macs and Windows ships with the drive; if you're using OS/2, you'll need to purchase the Zip Tools software separately from Iomega for $20.

Q17: What's this Zip Zoom SCSI adapter all about?
A17: It's a SCSI-1 ISA card based on the Adaptec 1505 and has an external 25-pin SCSI connector. It doesn't have an internal SCSI connector, but it does seem to allow you to chain other SCSI devices off of it either before or after your Zip drive. If you want SCSI-2 or a bus-master card

(?) then you may want to buy a different SCSI card. Infoworld (5-1-95) reports backing up 397-MB in 57 minutes (6.97-MB/minute) and restoring that same data in 27 minutes (14.7-MB/minute) with the Zip Zoom adapter.
J Greely <jgreely@Synopsys.COM> reports:
"Most SCSI controllers come with a driver for controlling non-standard SCSI disk devices (c.f. Adaptec EZ-SCSI ships with ASPIDISK.SYS); this will work with a Zip drive, but you won't be able to use the Zip Tools for formatting, locking, etc. One nice side effect of using a non-Iomega driver is that the installation will be unable to erase the disk, so you'll still be able to use it for a Mac installation afterwards.
"Some PC SCSI cards are too bright for their own good; a QLOGIC card I bought insisted on controlling the Zip drive itself, making it impossible to use the Zip tools. I replaced it with an Adaptec 1522, and all was well."

Q18: What about booting a DOS/Windows machine from the Zip drive?
A18: That depends on your SCSI adapter. The Zip Zoom doesn't support booting from the Zip drive, though other SCSI cards may.

Q19: My PC doesn't have a SCSI adapter. What do I do?
A19: You can either buy a SCSI adapter (from Iomega or from somewhere else) and run with it, or you can buy the Zip Drive-Parallel, which is (obviously) a Zip drive that plugs into a PC's parallel port.

Q20: How fast is the parallel version of the Zip drive?
A20: According to the readme.txt file, the transfer speed for standard parallel port is 2-6-MB/minute, bi-directional parallel port is 6-17-MB/minute, and enhanced parallel port is 17-22-MB/minute.

Q21: No, really, how fast is it in Real Life?
A21: Huei-Chin Lin <hueichin@macc.wisc.edu> reports:
"I had transferred a 12-MB zipped file from my Zip-disk to my hard drive, and roughly timing it. It took about a minute to transfer a 12-MB file from Zip disk to my hard drive. (My computer is 486DX2-50 with 8-MB RAM.) I had even zipped my whole window directory and subdirectories to my Zip disk, and it is only a bit slower than the speed I've got when I zipped the same thing to my hard drive (remember that I was using EPP capacities and I only tested it without any benchmarking)."

Q22: Why would I want a parallel version instead of a faster SCSI version?
A22: Not all PC's have SCSI adapters and you may not want one, so the parallel drive would be for you. Other than that, it's a matter of personal preference.

Q23: Windows blows chunks; I use OS/2. I guess I have to buy the OS/2 Zip Tools from Iomega, right?
A23: Right -- unless you don't want to. Zip Tools for OS/2 is reportedly available on Iomega's own BBS, so the only thing it'll cost you is the phone call and download time.
- - - - -
***SECTION 6: MAC AND PC INTEROPERABILITY

Q24: Can the Mac read PC-formatted Zip disks, and vice-versa?
A24a: For the Macintosh, yes. You will need a utility that will read PC-formatted disks. PC Exchange, which is included with System 7.5, works with mixed results. Several people have reported errors ranging from the inability to read the disk to outright trashing of the data on the disk, while others claim no problems with the utility. The general consensus seems to be that other programs, such as Access PC, work better than PC Exchange.
A24b: On the PC, I have no verified information on this.

Q25: Can I use the Zip drive with both my Mac and my PC?
A25: Yes. In fact, Iomega ships the drive with floppies for both Macs and PCs, but there's a catch. As soon as you run the program to install the Zip Tools utilities that are included on the Zip Tools disk, the installer will erase the partition (about 50-MB) of the system that you are NOT installing it for. (So if you run the install program from a Mac, it erases the DOS partition and vice versa.) Iomega's official position is that you have to buy a second Zip Tools disk if you want to install on both platforms, but of course that's not the only recourse. You have several ways to get around this.
The first solution (and, by far, the most convenient) is to run the Guest program from the Zip floppy disk to mount the Zip Tools disk, then use a disk duplication program (one that gets the whole disk, sector by sector) to dupe the Zip Tools disk onto a blank Zip disk. Some people have reported doing this successfully with the Disk Duplicator program that is on the Macintosh partition of the Zip Tools. Once you have a duplicate of the Zip Tools disk, you can use one to install for your Mac, and then the other to install for your DOS/Windows machine.
A second solution -- and the only recourse you have if you've already installed the Zip Tools software on one platform (thus deleting the other platform's software from the Zip Tools disk) -- is to go to Iomega's SIG on America Online. The files are available in their software library:
ZIPTOOLS.EXE ....Part one of the Zip Tools package for PC
FIND.EXE ....Part two of the Zip Tools package for PC
IOSCSI.EXE ......Iomega SCSI drivers, including the Zip Disk drivers for PC
Zip Tools version 4.2.1 .....The whole Zip Tools package for Mac
For Mac users, you'll need only that last file which contains the entire package. (NOTE: As I'm not an AOL subscriber, I don't know what format this file is. If someone would like to research this and get back to me, I'd appreciate it!) Those PC files are self-extracting archives, so for God's sake be careful! Make a directory called \ZIPTOOLS, move the ZIPTOOLS.EXE file in there and run it from that directory. Make a subdirectory \ZIPTOOLS\FINDIT, move FIND.EXE into it, then run that (from the FINDIT subdirectory). For further instructions, read the README.NOW file in the \ZIPTOOLS directory. To install the SCSI drivers, make a directory called \IOMEGA, and move the IOSCSI.EXE file there. Now run it from that directory. Run MANUAL.EXE and read how to install it. You can use the INSTALL program or do it manually.
- - - - -
***SECTION 7: OTHER PLATFORM ISSUES

Q26: Does the Zip work with other, non-Mac and non-PC platforms?
A26: Yes, but it's a mixed bag. Most other platforms (i.e., Apple II, Atari 8-bit, Atari ST, Amiga, Commodore 64) have some sort of SCSI interface option wither built-in or available as a third-party expansion box or card, so physically connecting the SCSI version of the Zip drive is as simple as plugging in a cable. The greater issue lies with software; Zip Tools is available only in Macintosh, PC/Windows, and OS/2 flavors so everyone else is pretty much on their own.

Q27: What's been reported so far that works and doesn't work?
A27: Not a whole lot of adventurous souls out there, unfortunately. It has been reported and confirmed that the SCSI Zip drive works with Atari 8-bit computer with the "Black Box" interface unit and SpartaDOS. As the Atari 8-bit cannot recognize any partition larger than 16-MB, SpartaDOS must format the Zip cartridge as multiple partitions in order to fully utilize the entire Zip cartridge.
I have also had 2-3 vague reports of the SCSI Zip drive working nicely with the Amiga computer, though nobody who uses that platform has contacted me with verification and specific details.
A similarly vague report has been sighted from an Atari TT user, though again, nobody who uses that platform has contacted me with verification and specific details.
- - - - -
***SECTION 8: ZIP AND IOMEGA RUMORS AND NEWS

CONFIRMED: Power Computing, the first licensed and authorized manufacturer of Macintosh clones, now has an internal Zip drive for the Power Computing clones available as optional equipment. Furthermore, Iomega has publicly stated that they're working on an internal version for end-user installation in other machines. I do not have final pricing information on this option; I expect to see Power Computing at Boston MacWorld Expo and will seek the information then.

CONFIRMED: Iomega is working on a larger capacity removable storage drive now known as the "Jaz" drive. The Jaz drive is expected to cost ~$500 for the internal version (~$600 external) and use ~$100 3.5" cartridges that hold 1-GB apiece. The drive resembles a larger version of the Zip drive but is colored dark green rather than dark blue; the cartridges are about twice as thick as a Zip cartridge. Further information is expected at Boston MacWorld Expo.

CONFIRMED: At a recent MacWorld Expo in San Francisco, Iomega was giving out "dummy" Zip cartridges, presumably as some sort of promotional gimmick. If you have one of these dummy cartridges, return it to Iomega and they will send you one real, 100% usable Zip cartridge, absolutely free. Joy!

RUMOR: A longstanding rumor about a 200-MB Zip drive has touched just about everyone's screens. To the best of my knowledge, this rumor started when, in an interview regarding the Zip drive, an Iomega executive made a statement to the effect that "Zip technology is at its infancy" and that "it would be easy enough to make a Zip drive that can store twice the current amount or more." Needless to say, many people took this to mean

that a 200-MB Zip drive is in the works. As best as I've been able to ascertain, *a 200-MB Zip drive, if it ever comes to light, will not be available anytime soon*. Realistically speaking, this makes lots of financial sense for Iomega. 100-MB Zip drives are selling faster than Iomega can make them; if they make a 200-MB drive available now (or within the next month or three), that will instantly cut 100-MB Zip drive sales down to the bone as people wait for the 200-MB drives. Why cut their own throats? I don't doubt that larger capacity Zip drives will *eventually* come to light, but I also believe that it'll be at least half a year before we see them. (The Jaz drive that is being developed may be the drive which this rumor sprouted from.)

- - - - -

***SECTION 9: BENCHMARK RESULTS

Many people had requested more solid reference numbers to compare the SCSI Zip drive with other types of storage devices. Okay; here ya go. These results were obtained using Norton Utilities 3.1's "System Info" program on an accelerated Mac IIci (DayStar Turbo 040i @ 33Mhz) with 32-MB RAM (real RAM) running System 7.5.1 and with no non-System-7.5 extensions loaded except for the Iomega Driver; disk cache was set to 256K. The IIci's hard drive and the SyQuest were formatted with Silverlining 5.54/23; the Zip was formatted using Iomega Tools 4.2, though identical results were obtained when the Zip cartridge was formatted with Silverlining. Note that specific results will vary a bit from machine to machine due to CPU speed, system configuration, specific architecture, etc.

MAC IIci HD ZIP-100 44-MB SYQUEST

***SECTION 10: IOMEGA ZIP vs SYQUEST EZ135

SyQuest will soon be releasing a new drive called the "EZ135" (formerly known by its code name, "Roadrunner"). This drive will reportedly cost ~$230 for an external version (~$200 for an internal version) and use ~$20 cartridges that store 135-MB each. EZ135 weighs about 2-3 lbs (considerably more than the diet-conscious Zip), but is also about twice as fast.

There are many mixed messages about which drive will ultimately prevail. However, I personally feel that the Zip drive will be the winner for several reasons. Here's why:

* The Zip drive is cheaper. Zip costs $200 for external, while EZ135 is ~$30 more. Furthermore, the Zip drive is now available internally from Power Computing and soon as an end-user installation kit, and chances are it will cost considerably less than the EZ135's internal price of $200.
* Zip cartridges are smaller, lighter, and more transportable. EZ135's cartridges will likely need to be stored in the same sort of padded carrying case as "standard" SyQuest cartridges. As a result, you'll see less of them being used with portable computers and, consequently, with desktop machines.
* Zip already has a substantial market lead over SyQuest. Historically speaking, the Mac market hasn't had much in the way of brand-loyalty. SyQuest drives became the predominant standard not because of any outstanding features, but simply because they were cheap in comparison to the more expensive Bernoulli drives. However, I can count literally hundreds of people who have abandoned their SyQuest drives for the Zip drive.
* The Zip is being offered as optional equipment in Power Computing's Mac clones (and hopefully -- eventually -- Apple's own products), whereas the EZ135 is not. This has the potential to give the Zip drive an even larger marketing lever.
* Though EZ135 is faster, Zip is already fast enough for the majority of users. QuickTime movies, sound files, and similar time-intensive files play just fine from Zip. Only a comparatively few users will actually _need_ the additional speed that EZ135 offers, and when you consider this in relation to everything else, the EZ135's speed becomes a not-so-important factor.
* EZ135 cartridges hold about 30-MB more data after formatting, true, but is that enough to justify a more expensive, heavier drive? I don't think so. Again, the fact that the Zip is so easily transportable makes it the better drive, regardless of the data storage capacity. If SyQuest's new drive were to hold, say, 200-MB or more it would be a considerably different story.
* People may be angry at SyQuest for "holding out" on the community. More than a few users have wondered out loud why SyQuest didn't introduce the EZ135 before Zip came on the scene. The most logical answer is that SyQuest was making so much money off its other, lower-capacity drives that they didn't want to rock the boat by introducing the EZ135. Only when Iomega started severely cutting into SyQuest's market did SyQuest respond with the EZ135. In short, it seems that SyQuest was more interested in lining its own pockets instead of advancing the technology. While this is probably good for business, it doesn't make the users any happier.

It's ultimately a simple matter of time deciding which drive will prevail, but if I had to place money on the outcome, I'd bet on Zip.

3213. Looking for diskdrive controller chip

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-05 00:00:00 UTC
From: hallvart@oslonett.no
Message-ID: <3vve40$23q@sinsen.oslonett.no>
Source record: 25032
Cross-posted to: sci.electronics,comp.sys.atari.st.tech

I'm looking for a floppy disk drive controller for my Atari STe computer.
Atari supplies them, but for a price. I recently saw this in a list over chips
in the Atari computers, and see that Atari don't actually produce them, so my
question is;

Has anyone heard of these chips before and know where to get them
(and how much they cost)?

C302096-001A = Ajax FloppyController (DD/HD/ED) Toshiba
C302434-001/A = Ajax FloppyController (DD(HD/ED) National

As far as I know these chips are replacements for the Western Digital WD-1772,
except they can run HD and ED drives (16 and 32MHz) as opposed to the 1772
which can only run DD drives (8MHz).

Please reply via email: hallvart@oslonett.no
Thanks!

Hallvard

>NEVER back up to over 100 floppy disks. I'd rather stick my head in a
>bucket of cow shit than have to sit here for years swapping floppies !!
That's what I said about my two 540 MB Quantums. When I ran out of space, I
just bought a nifty little 2GB Conner. And just when I was about to test
the Conner by copying the Quantums to it, one of the quantums died.

And of course it was the one with MORe important stuff on it. I've lost more
than a week simply through being completely unable to work, to say nothing
about all the time I lost because the stuff already done is no longer there.

Let me tell you, BUY those disks and get to swapping......

: subject might follow-up on this post.
:
Even though the Barracuda was actually produced, a technical snag
prevents proper operation and therefore they can't release it. The Hawk
accelerator offers very similar specs, although the price is much less -
and it may be available within just a month or two (perhaps less) -

Specs are as follows:

The Hawk accelerator for the Falcon 030
(requires 3 solder joints -if I remember correctly)

System specifications:
- Plug and play design for ease of installation
- 128kb level 2 cache (256 optinal).
- 32 bit system RAM, made for plug and play with the
stock Atari Ram board, Supports 4/14 MB ram card or
72 pin SIMM modules.
- 32 Bit system ROM (ROM copied into/runs from Ram)
- 32 Bit TT compatible Fast RAM, up to 64 MB using
standard 32 bit SIMMs. This is an Option!

Video
- Enhanced video capabilities (like blow up hard II)
some available resoiutions are 448x512 true color,
896x512 256 color, 1280x968 in 16,4,2 color modes
- Video accelerator, 1 MB (2MB option)

Expandablity
- Like The Baracuda 040...

Performance Factor
- 100 % Compatible!
- 16 Mips at 48MHz (Falcon 030 3-4 Mips)
- 400-500% faster than a standard Falcon 030
- Enhanced DMA access.
- 1 wait state ROM.

- 0-2 wait state System ROM.
- 0 wait state TT Fast RAM.

Price: MSRP 725.00 USD!

3216. Re:Translators for OASIS

Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech,demon.ip.support.atari

I recently posted a request for people to translate the OASIS manual
into variuos languages.

The response has been very good, I have so far had offers of translation
into the following languages:-

German
Finnish
Swedish
Dutch
Spanish

I would still iike to add French and Itallian to the list. If anyone is
interested please feel free to get in touch.

Please be warned, I cannot make anyone rich for performing this task,
but as we intend to write a NOS replacement and a Web Browser which would be
shareware, free versions of these programs would of course be sent to the
translators.

Come on people, do your bit to keep the Atari scene alive, the more
people who have access to Atari software the longer we all get to use these damn
fine computers.

Thank you in advance to anyone who feels up to the task.

>You must type 'source setup f' not 'setup f'.

ah! just what I needed to know

>That's what the instructions say!

----------------quoted from install.txt ----------------------------

(5) You should boot into the MINT environment and arrive at a pound(#)
prompt. (Note: There will be NO visible cursor.) The next step is
to run a shell script called setup. The setup script expects one
parameter which is the drive letter you are selecting to make into

a MINT partition. After it setups that partition, for MINT, the
script will prompt you to insert diskettes 2 through 7 (720K) or
disks 2 and 3 (1.44M) at the appropriate times. These
diskettes will copy on the rest of the X-Windows environment.

---

unfortuately I'm a Unix novice but either way part five is now done.

I can now get into xwindows for the first time, unfortunately I can't
get the TT to boot into ST high (I dont have a monitor for TT high)
so the screen is all wrong.

I tried to get X-windows installed before the 'TAF' disks and never
got as far as this.

Thanks for your help.

jason.

>Can anyone tell me what I'm doing wrong, or not doing etc.?

I can see the problem right away. You're typing "setup f", when you should
be typing "source setup f" (that is, if it IS drive F you want to use!)
Incidentally, if you're interested, a faster way of installing the TAF disks is
to put the files from each disk on the root directory of whatever drive you
have the space for the files on (not F if you're installing to it, naturally),
then modify the 'setup' file to reflect the drive letter to grab the files
from. It's far, far faster (obviously) Here's an example.

---my own setup file ---

```
/c/minit.ttp -V -P -n 4 $1
cd /$1
mkdir usr
tar -xvzf /h/1a.tgz
tar -xvzf /h/1b.tgz
tar -xvzf /h/2.tgz
tar -xvzf /h/3a.tgz
tar -xvzf /h/3b.tgz
tar -xvzf /h/4.tgz
tar -xvzf /h/5.tgz
tar -xvzf /h/6a.tgz
tar -xvzf /h/6b.tgz
echo Done installing files, reboot and edit your C:\MINT.CNF file
```

This will grab the files from drive H, and send them wherever specified in the
'source setup 'x'' command.

Here's hoping I've helped.

Leslie

3224. tcsh shell #! problem.

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-06 00:00:00 UTC
From: ali@birnie.demon.co.uk
Message-ID: <807696258snz@birnie.demon.co.uk>
Source record: 25043

Hi all,
I like to use the tcsh shell when I am in Mint. However when i try
to run scripts beginning `#! /bin/xxxx', tcsh ignores the directive
and keeps on reading the script itself.

Can anyone tell me if this is a shortcoming in tcsh or whether a later
version would fix it (Idont know what ver i have, just the one that
came with the Mint Dist Kit).

Or is there something I should be doing in the start-up file. I cant find
any reference to #! in either the tcsh or the csh documentation.

Failing all else, can someone recommend a shell that features this
shell escape thingy and has all or some of the functionality of tcsh?

While on the subject of shells, can anyone tell me what is the
definitive current version of sh, ie one without major bugs.
I think i have gone thru about 5 `flavours' of sh, each with it own
peculiar outlook on the world.

regards.

You most certainly will need ld and the other Gnu utils if you are
going to do any real work with gcc.
They may be had from src.doc.ic.ac.uk in
/computing/systems/atari/uni-paderborn/MiNT/mgcc/mutil36.zoo
or ...../bmutil38b.zoo

From: glupien@cyber1.servtech.com
Message-ID: <402g7l$t2@murphy.servtech.com>
Source record: 25048

Hi People,

I just installed an ICD Link2 with an adaptec 5500
controller (SCSI to MFM) on my ST. This controller
handles 4 MFM drives at once. The Adaptec 4000 I have
works fine (both drives are recognized at boot) but
the 5500 drives are not(except for C). The boot program says
"controller not recognized" yet ICD Format lets me format
and partition all four drives and recognizes board. Is there anything I
can do to get the ICDBOOT to recognize more than just
drive C when I install this nifty controller?

Yes. I dumped everything off f and defraged etc the whole HD before I
started.

Now I'm looking for a way to boot the TT into ST high without going
into GEM. I gather that the TT doesn't have NVRAM like a falcon!

>Incidentally, if you're interested, a faster way of installing the TAF disks is

Interesting but surely it actually takes longer to move the files and
edit the script than to just let it get on with it.

Personally I've already got a lot further with the install disks than
I did a few months ago trying to work it out myself with zero
knowledge of UNIX...

What's the snag? Because those 040 boards seem to be _so_
difficult to produce, it appears to be either a incompatibility
of the 040 or that they can't adapt TOS to it. Anyone know some
facts ?

Sorry that's my fingers. It is as you point out #!/usr/bin/perl in
this instance. sh handles it OK, but tcsh goes off muttering about
misplaced "()" and such. Does the same with #!/bin/sh. Won't have
have anything to do with it. I have to do "sh script.sh" to run
and tcsh is big enough without helping it out with another shell.
4 Meg only goes so far.

> much better transfer rates at the same time.

Haven't seen it, though it could be made to work. The ST's parallel port
is a bit substandard so the hacks would have to be done at the the Linux/PC
end AFAIK.

Alternativly by a 16550A serial card for your PC. Then hack the ST serial
port to 38400. This will improve throughput a great deal. I can run my link
at 115200, the TT and my PC are up to it. This reduces PING times down
from 160ms @ 19200 to about 30ms.

:-)

> faulty. ICD PRO doesn't even see it as a SCSI device.

ICD Pro does not seem to register CD-ROM drives on bootup. It should make the access light flash though as it does scan the SCSI bus properly.

What does IDCHECK return? Also try doing a SCSI inquire from the SCSI.PRG supplied with ICD Pro. Both of these should show it up - though I must admit SCSI.PRG is tricky to use - and I couldn't get it to do anything sensible about 5 minutes ago! ;-)

You say it is properly terminated. Are you sure there is termination power (TERMOWR) supplied by the drive? The Link 2 doesn't AFAIK, and without TERMPWR then termination is unlikely to work. I have a 'fancy' Forced Perfect Termintor - an if this is fitted to a SCSI bus which doesn't have TERMPWR enabled then it will actually stop the machine from booting.

Do you have any other SCSI devices in the system also?

> Ant ideas or is there an FAQ on the subject?

There is a FAQ - but don't know where it is. Its basically a collection of known working configurations and general info which you already seem to know.

Any idea if 'Media Vison' is the real drive make - or if its badged?

Roland.

3238. [Q] MiNTNet Domain Names and other things

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-07 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <403oa8$rvs@status.gen.nz>
Source record: 25057

Hello,

I have recently obtained MiNTNet, and Sh, Ping and Udpprobe. I know that
I have a IP address of 202.37.142.29.

MiNTNet also wants me to give a "Name" of my computer in /etc/hostname.
Now, with my Shell account at the moment, the host I use is iconz.co.nz.
My email address is mbecroft@iconz.co.nz. What should I be putting in
here? My provider can't seem to help with this, as they have never seen
software that requires this information before.

And what should go in resolv.conf under domain? My host cannot help with
that either. I want either a Slip or PPP connection.

What I tried, was putting in /etc/hosts
202.37.142.29 iconz.co.nz icnz
^my ip addr.^ ^^^^shortcut which I made up

into /etc/hostname I put
iconz.co.nz

into /etc/resolv.conf I put
domain iconz.co.nz
nameserver 202.14.100.2
^^^^ The address my provider gave for the nameserver

and I left all the other file alone.

Then I ran a Terminal and dialled iconz, logged in as normal, but when
teh menu appeared from iconz asking for 1) Shell 2) PPP 3) SLIP I pressed
3 for slip.

Then I started up Sh, and put in
cd u:
/etc/slattach -l 202.37.142.29 -r 202.14.100.15 -t /dev/modem2
^My IP address^ ^"Gateway" IP^ ^Desired port^

Well, it sat there for ages, every so 10 or 20 seconds the RXD and TXD
lights on the MODEM would flash a few times. But it just remained in the
slattach programme. SO, I started up SH again in another Miniwin window,
and said:
Ping iconz.co.nz (iconz.co.nz had been setup to my IP Address as you saw
earlier.)
This seemed to go ok, when I pressed CTL/C it said 24 of 24 packets
recieved, packet loss 0%

Then I tried
udpprobe iconz.co.nz echo "Yeah!"

as the MiNTnet FAQ suggested, but it
came up with some 10 character or so error and wouldn't do anything.

All this time, slattach was still running in the Other Miniwin, so I
pressed CTL/C, and it stopped slattach and hung up the modem.

Can somebody who knows about MiNTnet please explain what I am doing wrong
and what I should be doing, particularly regarding the Domain names and
all that.

Thanks very much!

-Mario Becroft (mbecroft@iconz.co.nz)

Since the #! hack isn't supported by the kernel (MiNT) it has to be emulated. Both Perl and Bash have special code to emulate it, but it also works if the program is linked with a recent version of the MiNTlibs _and_ the UNIXMODE env var contains the `s' flag. Btw., the space after #! doesn't matter (but some OS's even require it).

3240. Humming/clicking power supply

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-07 00:00:00 UTC
From: pd@mole.bio.cam.ac.uk
Message-ID: <404th2$fsh@lyra.csx.cam.ac.uk>
Source record: 25059

My falcon really has died now! :(

A while back it decided not to start up properly (the display was corrupted, it was slow and eventually hung completely). I thought the problem was the memory.

Now the power supply has decided to die too. All it does now is make a humming/clicking sound when it is switched on (no power comes out). I can't tell where it's coming from, but I *think* it's either the switch itself or the big bit with high voltage stuck on it (well I don't know what it's called!). I don't want to stick my ear *too* close to a live power supply!

Does this sound fixable? Or do I need a new power supply?

I am hoping it was the the power supply causing the original problem as well. It will definitely be a lot cheaper to fix!

Thanks for any help,
Phil

Message-ID: <404tsm$g12@lyra.csx.cam.ac.uk>
Source record: 25060
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

How do you connect an internal SCSI disk to a Falcon? As far as I can tell the only SCSI connector is the external one. Is there an internal one as well?

I am trying to fit a SCSI disk inside my Falcon as well as the internal IDE disk. Is this possible? What happens to all the connectors on the back of the board if you put it in a desktop case? I thought the idea was to put everything inside the case.

Physical space inside the falcon isn't a problem, it's just the connector. Also, is all that shielding *really* necessary? :)

Thanks,
Phil

Yup, the i/o server is a modified 1MB MegaST (with a SCSI
driver chip called Morpheus) and the other board is indeed
the video (based on a chip called Blossom). Helios was
indeed the OS supplied wih the machine.

> Basically, I'm looking for any information about this
> machine; in particular, I'd be very grateful for
> pointers to any companies that might still be able
> to supply documentation for the machine and its
> software.

Perihelion still support Helios, but not the ATW bits of
it (the iserver and video driver, mainly). They publish
a book called _The Heios Parallel Operating System_ which
describes Helios in general, but doesn't help much with
the ATW aspects.

In sum I don't think you'll get documentation from any
company; however I have some provisional stuff from the
developer's kit which I could probably copy for you without
getting into too much trouble from either Atari or Perihelion
-- get in touch with me by email if you want to discuss this
further.

As far as the monitor and mouse are concerned, you're looking
for an Atari SM124 or SM144 and a standard Atari mouse (or
compatible).

Best wishes

Chris

Uh, so there isn't really any 32 bit ROM then, or did I misunderstand you?

>- 32 Bit TT compatible Fast RAM, up to 64 MB using
> standard 32 bit SIMMs. This is an Option!

As costly as they intended it to be for the 'cuda?
Wasn't the price quoted for that $200 or so for an empty board?

>- Video accelerator, 1 MB (2MB option)

What's this supposed to mean?
Is it the equivalent of a graphics card and if so, what res/colour?

>- 16 Mips at 48MHz (Falcon 030 3-4 Mips)
>- 400-500% faster than a standard Falcon 030

Would that be for 128kbyte or 256kbyte l2 cache or is it with burst RAM?

>- 1 wait state ROM.

Didn't you say it was copied to RAM?

>- 0-2 wait state System ROM.

And what's this?

>Price: MSRP 725.00 USD!

Wasn't the 'cuda supposed to cost little more than that ($800)?
I never heard of a 'video accelerator' for the 'cuda, but the rest
of the systems sounds much the same apart from the processor.

3245. MiNT and stuff how-to

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-07 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <4064m0$cr2@gti.gti.net>
Source record: 25064
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Ok, after a few requests regarding my posting my homegrown documentation
on MiNT, MiNTnet and other stuff, you can find it at:

http://www.gti.net/azog/mint-docs.txt

it's somewhat a large and rambling file... turned out that after I cleaned
it up so that others can make sense of it, I made more and more changes.
I still need to add GCC, MintOS and X to it, but it covers the basics
of MiNT, some of the more nessassary utilties like shells, and MiNTnet.

Any suggestions are welcome...

W>I can obtain most of the Address/Data and some of the control lines I
W>need from the ROM cart. port. The rest of the lines I can extend from
W>the CPU itself or from other points on the mother board.

You can get everything you need for an I/O port at the cartridge port,
provided you don't need interrupts - there are 4 readily decoded chip select
signals (2 upper / 2 lower byte, 2 for $faxxxx, 2 for $fbxxxx).

You can't write to that port, but you can decode a 256 (or 512) byte region
and latch the lower 8 addreess lines on a read access. By doing a
tst.b base+data or tst.b base+data*2, you can output 'data' to your latch.
I once built a I/O port with 3*8 bit output and 3*8 bit input from 7-8 TTL
ICs (3*LS244, 3*LS374, 1*LS138 I think).

W>I have a question though about the ST's "MMU" and Glue chips. I know
W>that the Glue chip decodes the 68k address bus and generates appropriate
W>chip select signals. I can add logic on my project board to decode
W>a presently unused section of the memory map and generate my own chip
W>select signals. So, my first question is: What are safe regions of the
W>memory map to use for this???

You can use $c00000 if you have got less than 12MB of memory and no extra
video card installed. Otherwide, get an ST IO map and choose a free area -
note, however, that in the I/O area the GLUE will generate DTACK for you!

You can get the DEV signal from the GLUE - you then only need to decode some
lower addresses plus LDS/UDS.

W>My other main question is about the Bus or Address Errors that the MMU
W>chip (I think that this is correct) generates if it sees an illegal
W>memory operation. Is the MMU hardwired to reject any memory I/O to
W>addresses which were not part of the original Atari design ??? Or does

The GLUE generates an bus error if it does not see DTACK after some number of
cycles.

>My email address is mbecroft@iconz.co.nz. What should I be putting in
>here? My provider can't seem to help with this, as they have never seen
>software that requires this information before.
That's strange, as it is common practice to have a name for your
computer. I think you need to be careful about choosing a name so you
don't muyck things up. Maybe the person you spoke to didn't know but
someone else in the company did? If the worst comes to the worst you
may be able to just make up a name ending in .iconz.co.nz (eg
myatari.iconz.co.nz) but it would be better to talk to someone who
knows for sure before you fiddle.
The name is just a shortcut for the IP address to make it easier to
remember, but as I said you can't just make on up randomly.

>And what should go in resolv.conf under domain? My host cannot help with
>that either. I want either a Slip or PPP connection.
domain iconz.co.nz

is probably what you want.

>What I tried, was putting in /etc/hosts
>202.37.142.29 iconz.co.nz icnz
>^my ip addr.^ ^^^^shortcut which I made up
Here is where you need your name, eg
202.37.142.29 myatari.iconz.co.nz myatari

>into /etc/hostname I put
>iconz.co.nz
once again, this needs to be your hostname:
myatari.iconz.co.nz

>into /etc/resolv.conf I put
>domain iconz.co.nz
>nameserver 202.14.100.2
> ^^^^ The address my provider gave for the nameserver
Thats fine.

>and I left all the other file alone.

>Then I ran a Terminal and dialled iconz, logged in as normal, but when
>teh menu appeared from iconz asking for 1) Shell 2) PPP 3) SLIP I pressed
>3 for slip.

>Then I started up Sh, and put in
>cd u:
>/etc/slattach -l 202.37.142.29 -r 202.14.100.15 -t /dev/modem2
> ^My IP address^ ^"Gateway" IP^ ^Desired port^
That looks fine. With the hosts file set up though you can do:
/etc/slattach -l myatari -r 202.14.100.15 -t /dev/modem2 &

The '&' on the end means run in the background - slattach quits when
the link goes down / the link goes down when slattach quits so you
don't wait for it to finish.

>Well, it sat there for ages, every so 10 or 20 seconds the RXD and TXD
>lights on the MODEM would flash a few times. But it just remained in the
>slattach programme. SO, I started up SH again in another Miniwin window,
>and said:
>Ping iconz.co.nz (iconz.co.nz had been setup to my IP Address as you saw
>earlier.)
>This seemed to go ok, when I pressed CTL/C it said 24 of 24 packets
>recieved, packet loss 0%
Sounds good.

>Then I tried
>udpprobe iconz.co.nz echo "Yeah!"
>as the MiNTnet FAQ suggested, but it
>came up with some 10 character or so error and wouldn't do anything.
Maybe because it was getting confused with iconz.co.nz was because you
said that you were iconz.co.nz, and the nameserver pointed to
somewhere else. It may work when you have soprted out a name.

>Can somebody who knows about MiNTnet please explain what I am doing wrong
>and what I should be doing, particularly regarding the Domain names and
>all that.

Well domain names are just like a hierarchical structure saying where
your machine is. Eg my machine's name is:
bigbox.demon.co.uk
^^^^^^ ^^^^^ ^^ ^^--- In the UK
| | |------ A commercial company
| |--------- Called demon
---------------- My machine name

My domain is therefore demon.co.uk

Hope this helps. (Its worth the effort to get MiNT and MiNTnet running
- really :-)

>or is this not how it works?
Slattach is run in the background (by following it with & in sh) and
that allows you to have an easy way of clearing up when you drop the
connection - when you kill slattach or hang up, all the routing info
and so in is cleaned to remove your gateway host and so on.

>Also, what does it mean when DIP says "You don't exist - go away" when it

>DIP past this strange sounding error!
Dip requires a much stricter Unix setup than other utils. You will
probably need a /etc/passwd containing an entry for root (assuming you
run as root and not logged in as a user somehow). You will probably
need things like /etc/dipusers too.

3250. Re: [Q] MiNTNet Domain Names and other things

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-08 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <406ri0$gfv@status.gen.nz>
Source record: 25069

Well, I have managed to make a connection with MiNTnet now. I just experimented with the files until it worked. But, at present I dial in my terminal emulator, login and select slip, then go into Sh and type
cd u:
/etc/slattach -l 202.37.142.29 -r 202.14.100.15 -t /dev/modem2
my ip addr. host's ip addr. port modem is on

Then, most of the time, the modem's Read Data and Transmit Data lights flash after about 10 seconds from pressing return on the above line. Exactly when the lights flash, the mouse pointer vanishes. Not only that, but the nouse does not work. It's not just vanished, the qhole computer seems to have frozen up. So I press CTRL/Undo, which terminates all the programmes I might have running, but SH and Slattach do not get terminated. The mouse comes back however, and I can run Ping and DuFTP without any problems.

This, however, seems to be a long way to go about it. If I could just get the mouse to stop vanishing it would be Ok. Also, when Slattach is running, is it meant to keep running for the whole time I'm online? Whenver I press CTRL/C to slattach it hangs up and terminates. Shouldn't I let it hook up, then terminate slattach once the connect has been made, or is this not how it works?

Also, what does it mean when DIP says "You don't exist - go away" when it is run??? I have had to use a Terminal to dial for now, as I can't get DIP past this strange sounding error!

Thankyou very much for any help.

>the Zip drive does not provide.

Unfortunately, it is not IOMEGA's fault. You're laying the blame on the
wrong company, if my SCSI knowledge isn't too rusty. On the SCSI spec, it
says that the host adapter should have the ability to provide TERMPOWER.
So the Adaptec MiniSCSI adapters should be providing termination
power, and not the Zip drive.

Now, Adaptec might be very limited and constrainted when they made those
parallel-to-SCSI adapters. There really isn't that much power to be drawn
from a single parallel port. So they sacrificed one thing (TERMPOWER) for
another (portability).

Someone correct me if I am wrong.

--Ed

They will work, however, if (still

3252. PCs, STs and monitors

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-08 00:00:00 UTC
From: bjb@praxis.co.uk
Message-ID: <407mnc$3t5@skolem.praxis.co.uk>
Source record: 25071

I'm sure I've recently seen a discussion on this recently but I can't remember the answers.

A few questions on PCs, STs and monitors.

1) (How) can I use an SM144 with a PC (VGA port)?
2) How likely is it that an average of the shelf PC monitor will work with an ST? What do I have to look out for?
3) And finally, I am thinking of getting a monitor to use as a hi-res ST monitor and a colour 1024x768 monitor on a PC (linux - not DOS/Windows ;-). It would be an advantage if the monitor also worked with ST low/medium resolution too. What sort of monitor would I need to do this?

Thanks for any help.

This Morpheus chip is located at address $FF0000 in the memory of the ST. It
controls the SCSI interface (I think it's SCSI-1), and the diagnostic bus. Via
the diagnostic bus transputers can be reset etc.
The TOS version is 1.2 but you can upgrade to 1.4 by just replacing the ROM's.

>-- get in touch with me by email if you want to discuss this
>further.

Atari Benelux said they didn't support the ATW anymore. I could not even get
any docs. Perihelion can still sell the Helios software for about 800 pounds
sterling. Just a little to expensive for me (for a completely unsupported
system). However, I am porting the INMOS standard iserver so I can use
the T800's (still in pre-alpha state:-)
But I've still got a few problems: can't get the T800 on the motherbord
running (farmcard Ok), and the system crashes if I try to read anything from a
Quantum LP105S SCSI disc. So I'm using a Megafile 30 disc on the DMA port and
the first processor of the Farmcard as my root processor.

>As far as the monitor and mouse are concerned, you're looking

Does anybody know how to make a cable for data transfers between
portfolio and a pc using their parallel ports? Pin layout?

The manual of the portfolio parallel connection says 'cable with a 25
pin D-type male connector on each end, or an adaptor to a(?) convert
Centronics to 25 D-type connector' ((?) is mine) for file transfer.
I know that there are more than one possible parallel connections
(unlike for serial connections), depending on software.

I tried to ring Atari Computers here in Sydney, but they seem to have
vanished into thin air.

Fake dip out with an /etc/passwd file:

root:0:0::root:/:

You may want to do the same for a uucp username, as dip wants to lock
the modem under uucp. It'll still work. Create /usr/spool/locks
as this is where lock files live.

3258. [Q]UnGZipping Elm, and where to get Pine?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-08 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <408o1l$272@status.gen.nz>
Source record: 25077

Hello,

Well, my MiNTNet Setup would appear to be working sort of Ok, but it's not much use without a mailer programme.

So, having downloaded Elm from ftp.cnam.fr, I tried to de-archive it. It is Tarred and GZipped. I have de-archived TGZ files before without a problem, but this one will refuse to work. GZip just says "<name of file being decompressed> Filename Truncated" when I try to decompress Elm - the filename is something like elm2.4.3.tgz. I may be totally wrong about the version though. Anyhow, after this it sits thre doing (seemingly) nothing. I left it for about 10 minutes and it was still doing nothing, so I pressed CTRL/C and it terminated. But the file was not un-archived. It was still just the same as it was when I started.

Any ideas?

Even better, where can I find Pine compiled for MiNT?

Also, where can I find Talk compiled for MiNT?

Thanks for your help!

I have got DIP, but I can't understand the first thing about it.

All I want to do is dial the phone, enter my name and password, then choose 3 for slip, then automatically run slattach.

I think this is what DIP does, but it is terribly complicated. Is there a simple programme which can do this, which anybody can understand, or will I have to write it myself? Even if I have to run slattach manually, that's Ok. I just find it tedious having to load up the terminal, ring up login, then load a shell and run slattach. If I could just double-click on login, then double click on slattach, it would be Ok.

Thanks for any help!

>itself or the big bit with high voltage stuck on it (well I don't know
>what it's called!). I don't want to stick my ear *too* close to a live
>power supply!

Sounds like what my power supply did when it went out on me. Hummed a bit,
but otherwise the whole system would come up with a black screen or failing
that would crash in mid boot, THEN go to the black screen if you reset.

>Does this sound fixable? Or do I need a new power supply?

You'll need a power supply, I'm sorry to say. The only Falcon repair shop
here in the US said that even they can't fix one, they don't sell parts for
one, they don't even have a schematic for one... :P

>I am hoping it was the the power supply causing the original problem as
>well. It will definitely be a lot cheaper to fix!

It will be- relatively :) My new power supply ran me $100. If someone
came out with a more reliable and cheaper aftermarket p.s. they could make
a fortune....

Sorry I couldn't give you any good news- hope this helps out somehow.

3264. null-modem connection - how?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-09 00:00:00 UTC
From: contacts@mini.mits.mdata.fi
Message-ID: <409t0t$pp@news.mdata.fi>
Source record: 25081

Could someone please explain how a file transfer is done via null-
modem cable and two computers? What software is needed and how
they are used (what settings)?

Does the 25-pin -> 9-pin converter change the null-modem cable
connections?

Reason I'm asking this is that my little brother came to visit me
with his Amiga 1200, and we'd like to transfer some stuff around.
I already have a null-modem cable, so I don't need instructions how
to make it. We just couldn't make any connetion via terminal
software.

BTW: Having an Amiga 1200 and Atari Falcon in the same monitor (my
MAG has two inputs switchable from front panel) is a nice way to
compare speed, display and feel of the machines. Funny thing is
that Amiga 1200 has only 4-5 resolutions (out of ca. 100) that
work on a high-class multisync: these better multisync-monitors
cannot display rates below 50Hz and 30KhZ.
You have three guesses which machine looked, felt and performed
totally utterly better....

3265. Re: [Q]UnGZipping Elm, and where to get Pine?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-09 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <409eq1$8rh@status.gen.nz>
Source record: 25082

Hello,

Well, it turns out that elm ungzipped without a problem after speicying
-v (--verbose) on the commandline.

However, now that it is un gzipped and un tarred, it won't work.

First, my home enviromnet variable is set to "u:\home\mb\", where u:\home
is a symlink to u:\usr\users\.

However, Elm made it's .elm folder on the root directory of my minix
filesystem (g:\) instead of my home dir.

Should I be saying /home/mb/ instead of u:\home\mb\ ?

Anyhow, it still started up and idn't crash, but it did not show my
inbox. I am not surprised, however, as I found nowhere to specify where
my inbox is located. (it is located at iconz.co.nz in directory
/var/spool/mail/mbecroft.)

As far as poisting mail goes, it just crashed when I chose send after
putting in a message.

Basically, I have absolutely no idea what I should be doing with Elm. All
I've done is de-archived the archive, and run Elm just as it came.

Can someone please help, or suggest an alternative programme (I am used
to operating Pine, but can't find a MiNT version anywhere.)

Thankyou very much for any help!

TOS 3.06 is a 32-bit ROM. However, I suspect the problems are to do
with the use of a 68040 instead of a 68030 - there are slight
differences (extra caches, and so on) which meant that, for example,
the Medusa couldn't run at its full speed when I saw it a year ago.

> with ST low/medium resolution too. What sort of monitor would I need
> to do this?

A Microvitec 1428 will do all this - though the 1024x768 will be
interlaced. I've had all ST modes, all TT modes (except TT-Hi) and upto
800x600 under Windows and Linux/pc running fine on one.

Microvitec are on 01274 390011 (UK) if you are interested. I got mine from
System Solutions though. Cost about 300ukp inc.

Phillip Davey (Path) (pd@mole.bio.cam.ac.uk) wrote:
: How do you connect an internal SCSI disk to a Falcon? As far as I can
: tell the only SCSI connector is the external one. Is there an internal
: one as well?

Nope.

: I am trying to fit a SCSI disk inside my Falcon as well as the internal
: IDE disk. Is this possible? What happens to all the connectors on the
: back of the board if you put it in a desktop case? I thought the idea was
: to put everything inside the case.

Put it in a tower case and you'll be able to run a line directly from the
SCSI-II connector to the drive internally in the tower case. Impossible
with the existing Falcon case.

: Physical space inside the falcon isn't a problem, it's just the connector.
: Also, is all that shielding *really* necessary? :)

The shielding not only keeps your neighbors from running you out of town,
because you'd ruin their TV reception; it also prevents your Falcon from
being interfered with by external radio sources (CB's, HAMs, Cellular
phones, etc.). Besides, with the limited space you destroy the small
amount of air space that the puny little fan needs to cool. Things are
already running pretty warm as it is.

Rich

: It isn't the hard disk, floppy, monitor or blowup as it does the same
: thing with or without these.
: I have also had a look at the board and chips but nothing looks out of the
: ordinary.

: I hope it isn't the memory because that is expensive! :(
: If it is overheating, what can I do about it? Will a fan next to the
: machine help?

First, try the simplest remedy. Reseat every single socketed chip , ie:
pull them out and reinsert them. This includes removing the RAM board
and reseating it too. If that doesn't work, then check your power
supply. It may be sending out more than +12 and +5 volts (naughty!).
Typically a faulty power supply makes whining or clicking noises.

Check to see if the first and third (from the left) jumper pads are
shorted. They are responsible for RAM and ROM timing.

Finally, if things are still not working, then check for hot chips. This
means check to see if you can boil eggs on one of the chips. My guess
would be (if it's a bad chip) in order of probability:

1> CPU (right in the middle of the left expansion connector)
2> FPU (if you have one, under the power supply, socketed)
3> VIDEL (Under the IDE HD, big sucker)
4> One of the GAL chips (Bottom center, socket chips; also far right)
5> ROM (tiny socketed square under RAM)
6> RAM (big board plugged in on right)
7> COMBEL (big sucker above GALs and to the right of CPU)
8> Any of the rest (aaah!)

Good luck!

Rich

3274. Please, need help with NEC 2A monitor

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-10 00:00:00 UTC
From: scifi@ionet.net
Message-ID: <40c2kp$8ut@ionews.ionet.net>
Source record: 24943

At a local second-hand store, I found a NEC MultiSync[tm] model 2A monitor. I was told it would sync down to the standard TV frequency of the ST's color modes. I'm having problems getting it to work in those color modes. My home-spun DB-15 connector did work with an AOC multisync in all ST video modes, so I'm sure it is wired correctly. The NEC does work with monochrome 640x400 just fine (I'm using it right now typing this ;). Yet it doesn't want to lock in on the color 15kHz horizontal signal -- it does lock in on the color 60Hz signal, there's only a doubling horizontally of the image, which is completely stable otherwise. I thought these older NECs "did it all" like my AOC? (It is difficult finding such models anymore (thanks to "the market".) The NEC 2A has a bigger screen than a SM124, better for my MIDI stuff. What can I do to make the NEC 2A work in the color modes?

Thanks in advance -- Paul Seniura (in OkC)

3275. What is Inetd, and how to get Mail/News

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-10 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <40c46h$g3t@status.gen.nz>
Source record: 24944

First, what is the programme INetd? Do I need this to use Talk?

Second, I am quite confused about what software I need to recieve and send email with MiNTNet. Normally, I call my host with a VT100 terminal, and run Pine on my host's computer. Normally, my inbox is located in /ver/spool/mail/mbecroft. Do I have to FTP this inbox to my computer and then look at it with Elm every time I want to se my mail? Can't I just make elm look at my mail directly from my host? Also, if I can look at it directly, without FTPing my inbox first, will it read the entire inbox? i.e., say I have a 200K inbox. The message I want to read is only 2K. Do I still need to get the entire inbox just to read the one message?

I know _absolutely_nothing_ about how email works on the internet, so you'll have to explain even the simple things.

Also, I naturally want to see Usenet through MiNTNet? Again, I know nothing about how this works, so what programmes do I need, and how do I set them up?

At the moment I have DIP, gopher, lynx, finger, ping, ftp and they all work fine.

Thanks very much for taking the time to reply!

Well, I'm in the repair business myself. If you can't find an Atari-dealer
who can fix them, try one of the repaircenters just at the first corner.
A small shop that also does TV- or monitor repairs is your best bet.
The bigger the shop the less probable that they will accept it, but if
you can talk to the repairman himself he'll probably repair it for you.
A price of $30 - $60 seems fair.
Those switched-mode powersupplies are very straightforward and simple to
fix for a competent repairman.
But just bring the PSU, _not_ the whole computer.
Be _careful_ though as defective powersupplies can keep a _lethal_
powercharge for up to several(!) months !

From: mbecroft@iconz.co.nz
Message-ID: <40carc$3el@status.gen.nz>
Source record: 24948

Hello,

I have recently been setting up MiNTNet, and one of the programmes I have used is Lynx compiled for 020 (I have a TT030.)

Lynx works perfectly, until a web page is accessed which is larger than about 3K. After about 2K of data is transferred, the machine Hangs, causing a reboot to be necessary.

I have a 2400 BPS MODEM, with V42bis, so I have my port set to 9600.

Any ideas as to what is causing this?

Also,I have tried to retrieve a GIF picture using Gopher. However, the picture came out with only the top 3 or so scanlines intact, the rest aws just black. So, I tried the same thing with Lynx (as Lynx can handle Gopher) and this time the first 200 lines or so came accross fine, the rest being black. Any ideas about this?

Thanks very much for any help!

It's a Fujitsu 230MB 2.5" Powerbook Hard Drive Model M2637S (purchased from Mygate Limited, Units 9 & 11, Southbrook Industrial Estate, Southbrook Road, Lee, London SE12 8LG, 0181-318-1424, fax: 0181-318-1802, Applelink MYGATE.UK --- anyone got a WWW or email address for these people please?)...

However it doesn't have a jumper for the terminator option, jumpers are as follows
J7 }
J6 } - SCSI ID
J5 }
J4 --- Power Up ?
J3 --- Parity ?
J2 --- Unit Attention ?
J1 --- SCSI Level (for SCSI-I or SCSI-II - I like SCSI-II)
xx }
xx } - not used (apparently... I wonder if this is just "not used for the powerbook)

Apparently the power lines (end 8 pins on the connector) weren't connected in the powerbook, it used the SCSI lines to get the required power!

Help please....

Thanks in advance,

Neil
(nab@comp.lancs.ac.uk)

>with the existing Falcon case.

Does this mean the case has to be bigger than the board to accomodate the
space used by the connector?
Any suggestions for cases?

>The shielding not only keeps your neighbors from running you out of town,

So where is it possible to get your hands on an ATW and how much does it cost these days? Just curious - might want to have one and solder it onto my M4STe or something. ;^)

|> with ST low/medium resolution too. What sort of monitor would I need
|> to do this?
|>

The ST Hires output is not VGA. It is close (ST = 32kHz, VGA = 36kHz I think ?)
I would try and get hold of a multisync monitor with a range from 15kHz to 36kHz
or thereabouts as this should encompass ST low/med res (15kHz)as well as ST hires
and VGA. Actually if you want 1024x768 then you may need an even higher sync rate.
Maybe a multisync from 30kHz to 60kHz or so maybe more useful. I think your ideal
sync range appears to be 15kHz to 60kHz but I don't know if you will find a
multisync with such a wide spread.

3288. MinixFS problem

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-10 00:00:00 UTC
From: thopman@uoguelph.ca
Message-ID: <40dg7c$9uu@ccshst05.cs.uoguelph.ca>
Source record: 24957

I'm having a problem with MinixFS. I am basically unable to initialize a partion using minit. I know it works, since I've done it before. I think the problem may lie with the hard disk drive I'm using, namely v6.5.5 of the ICD Pro driver. When I try to use minit, I get a message saying:
pid 5 (minit): minixfs: Rwabs returned 65525 sector 1 drive I:
Partition I: is about 100 megs, and obviously has 4096 byte virtual sectors. It's the only partition on the drive with sectors that size. The drive is a Maxtor LS-340 (or something like that) formatted with the ICD Pro utils.

Thanks...

>(by shielding I mean the metal sheets screwed on to cover up the board)
>What is likely to happen if I take some or all of it out?

It depends where you're operating your computer. In a domestic
situation it is very unlikely you will have any problems if you remove
the shielding. You may get interference on your television or radio if
it is too close however. In an industrial environment (where it may be
close to switchgear, or automotive machinery) the electrical noise can
upset the computer (and even corrupt RAM contents). I suppose it is
possible that the hard disc could get corrupted by high magnetic fields,
although I doubt that the flimsy shielding in the falcon would reduce
the field strength by much anyway.

: (by shielding I mean the metal sheets screwed on to cover up the board)
: What is likely to happen if I take some or all of it out?

Yes, it is *really* necessary. SHIELDING has its name for a reason. It shields out unwanted radio frequency interference and shields external devices from the Falcon's own radio frequencies. You are better off getting a bigger case to put your Falcon in so you have the room. A metal tower case has excellent shielding and plenty of room.

Besides, removing the shielding hinders the air-flow from the already wimpy fan.

You may be able to operate your Falcon for months at a time without any problems and complaints from your neighbors (if you're lucky), but say "bye bye birdie" if someone decides to key in their 500 watt linear CB amplifier near by.

You have been warned :-)

Rich

3296. MiNT aware zmodem program?

My ATW came with Helios, and Perihelion allowed me to upgrade (perhaps
they changed their policy when Atari dumped their stock? Couldn't
blame them for that.) So far everything works except the X driver
(can't get my SVGA monitor to sync to the ATW's VGA-like modes).
Disc access is slow, but works. (The disc drives are pretty old, but
I think that going through the chain Morpheus->STRAM->iserver->tp-link
has something to do with it. Anyone seen an ACSILA lying around?)

Source record: 24970

Well, after doing a memory upgrade on this thing, of course the power supply
decides to die on me... Anyway, shortly after upgradeing this 520STfm to 1mb
by
sodering in a bunch of RAM chips, the power supply has been doing bizzare
things, (at least I think* its the power supply) at first when you fliped it
on,
it would sit there with a black screen and the power light off for half a
second
or so before it jumped to life. Not very long, but noticable. Over the course
of
three days this pause got longer and longer. Now its to the point that when you
flip it on from a totally cool state, it sits there for about 5 seconds, and
after about an hour, when it gets warmed up, it won't even turn on until it
gets
cooled off! Arrrggh! Well, I took it apart and I noticed a resistor was
cracking (!!!), but nothing else seemed out of order. Of course I forgot to
note
the model number of the power supply, and the location of the cracking
resistor...
(i do* remember that it was an Atari PS...) (Ghod them 1040-style cases are a
pain in the ass to dissassemble!)

There is a version of NOS at ftp.dungeon.com in /pub/atari that support POP3
mail...

ATTENTION: This reply is written by a member of
the Jaguar Server Design Team!
Some of the opionions stated below may not be those of the whole
Design Team.

A lot of rumours have appeared on the net concerning the Jaguar Server.
This follow-up is written to clear the air...

The Jaguar server is a gadget you insert into the cartridge port of a
MEGA/ST/E/TT/FALCON etc and allow you to produce games/demos etc
for the Atari Jaguar tv-game.

The Jaguar Server uses the INTERNAL memory of the Jaguar it is not a
copier. You can NOT copy cartridges. You can NOT emulate cartridges.
It ONLY USES THE INTERNAL 2 MB memory of the Jaguar. Again YOU CAN NOT
COPY GAMES with the Jaguar Server. The supplied software nor the hardware
cannot be used for copying games. And software cannot be written to perform
such a task.

The Jaguar must be modified so it can communicate with the host-computer
and. This modification also involves adding a development OS to the Jaguar.
The OS makes it possible to single-step a CPU and or GPU/DSP program and
download/upload programs to the internal 2MB of the jaguar. It also enables
the programmer to set breakpoints and run programs. To simplify development
a resetbutton is added. The modification does not enable the user to emulate
or copy cartridges or CDs or whatever..

The Jaguar Server is currently supplied with a program that allows you to
download/upload and run programs in the internal memory of the Jaguar.
Under development (by me) is a MonST lookalike remote debugger which is
using GEM. The debugger will be expanded with an editor and a 68000/GPU/DSP
assembler. With the debugger you can debug programs interactivly.

We will not supply any documents on the jaguar hardware. For this information
we suggest the user to buy the "paper-only" development system from Atari.

In article <40gphm$25g@express.ior.com>,
Frans Keylard <fkeylard@on-ramp.ior.com> wrote:
>>>Let me leave you with some questions:
>>>1) Do you really think the $5500 figure is based on cost???
>
>>To some extent (it must cover their costs), but yes, you are right.
>
>It has nothing to do with cost, it's much more like the deposit you
>lay down when you rent a moving van, except you get your deposit back

>(and then some) when you actually produce a good game. It's a token of
>good intent, this figure IS paltry when compared to dev costs for the
>other systems.
>

True but it is still way too high to allow all "underground" game program-
mers that are coding games. Remember that Unique , Thallion , Eclipse
and many of the popular game companies on the PC-market would never ever
been brought to life unless the production cost for a game was so low. You
simply start with the same equipment you used for demo-making that is a ST/
Amiga/PC and assembler/musicprog/artprog and you put a little effort into
it.

The Atari development system is very cheap, but it is not cheap enough to
allow hackers/home programmers/democrews to have some fun with a killer
system.

>>>2) If everybody could "develop" i.e. "copy" Jaguar games, especially
^^^^^^
You cannot copy games with the Jaguar Server.
Are you suggesting that you can copy games with the Atari Development
System?

>>>those who did not even have the paltry $5500 to guarantee it (peanuts
>>>for a dev system), how many games do you think would be sold?
>

>think were produced on these systems for the SNES and Genesis? Nada!
>Since both companies are much bigger than Atari, they could "afford"
>the millions of dollars of lost revenue, but not without kicking and
>screaming. Atari on the other hand cannot.
>

No sweat since you simply cannot copy games with the Jaguar Server..

>Refer back to my first point in the original post. The answer I gave
>to the question regarding why it wouldn't be better for Atari if there
>were all these console copiers out there still stands. It isn't about
>the $5500. A developer stands to recoup that amount in sales, signs an
>NDA and gets the technical docs. These docs are highly protected by
>copyright, by the way.
>
>Owning a console copier is highly illegal, make no mistake about it.

Copying is illegal. The copying device is not. Just think: every single
one owning a cassette recorder (or harddisk/diskdrive) is a criminal :-)

Don't think I defend piracy. I don't,I have seen many of my products being
pirated.

>
>>So I don't think it is such a big problem as you suggest. What I was

>tool of the trade.
>

$5500 is quite a lot of money. Can you afford it, knowing that you cannot
get any income for about one year , an usual development time for a game
on a new platform even for a highly experiensed programmer. Many good demo
programmers who would love to code games and is often more experiensed than
older programmers are attending universities. They have no $5500 to spend on
their visacards

>>Thinking back to when the main games machines were ST's and Amigas, it
>>was possible (in fact much easier) to copy the commercial games. Although
>>this was a problem, it wasn't too bad. Much better than, for example, PC

>computers went down the drain in the first place? Just ask any
>developer, and he'll tell you how large and devastating the impact of
>piracy was. It was a vicious downward spiral!
>Cartridges are actually easier to copy than most disks, even things

That is simply not true. You must in anyway emulate the cartridge.
On an megadrive or SNES the cartridges were rather small and could
easily be emulated using quite little memory. The Jaguar's cartridges
are quite large (4MB) and all the games uses the internal memory.
The Jaguar Server uses only the internal memory and does not supply
any additional memory to emulate any cartridge

>like the Super FX chip in the SNES were duplicated. The console
>copiers were able to copy DKC before you could bat an eye...
>
>>Phil (who may be talking complete rubbish)
>

GEA>Hmmm... Think it'd work if you just pulled the write signal out on an extra
GEA>wire? Oh what the heck - anyone got wire for wire schematics for the VME bus?

No. You would have to prevent the bus error happenning when writing to the
port. I am not sure if it is the normal timeout buserror (then you would have
to assert DTACK), or if the GLUE generates it instantly upon write access
attempts to the port - which would not be easy to fix.

I would recommend using my proposed method (which has been in use for many
romport adapters foer a long time now) - and which has the advantage that it
works with every stock ST.

Andreas Schwab (schwab@issan.informatik.uni-dortmund.de) wrote:
: In article <807752684snz@birnie.demon.co.uk>, ali@birnie.demon.co.uk (Alasdair Campbell) writes:

: |>> > I like to use the tcsh shell when I am in Mint. However when i try
: |>> > to run scripts beginning `#! /bin/xxxx', tcsh ignores the directive
: |>> > and keeps on reading the script itself.

: Since the #! hack isn't supported by the kernel (MiNT) it has to be
: emulated. Both Perl and Bash have special code to emulate it, but it
: also works if the program is linked with a recent version of the
: MiNTlibs _and_ the UNIXMODE env var contains the `s' flag. Btw., the
: space after #! doesn't matter (but some OS's even require it).

I don't quite follow that. When you say `the program must be linked....',
do you mean the program that is being called by the #!, or the program
that is reading the script, ie tcsh in this instance. The Perl I am using
I have compiled myself to Mintlibs PL46. (Thanx MH if you're reading this!).
and it works fine if sh is running the script. So are you saying that I
must recompile _tcsh_ against yhe new Mintlibs?
BTW, I keep coming up against this UNIXMODE chap, and know nothing about
it (I am new to this stuff). Where can I find some info about it?
It was set to /cub, I tried /cubs but it made no difference.

Kind regards,

Alasdair.

3312. Sluggish V.34 Modem - Epilogue.

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-13 00:00:00 UTC
From: ali@birnie.demon.co.uk
Message-ID: <40kv3g$id@birnie.demon.co.uk>
Source record: 24981

The manufactures of the sluggish modem are themselves no slouches. USR agreed with me that the modem was faulty and on Monday it was off for repair. Friday arrived and along with it a brand spanking new modem. This one zzzzips. The RD light never goes out. tar.gz files download over FTP (PPP) at 2.96 K/sec. That's better!

So anyone who is not achieving this sort of xfer rate with ST(e), CD4040 mod and HSMODEM06 has something wrong.

Thanks again to all who helped, and thanks USR, if you are reading this, for excellent service.

regards to all.

3313. Re: What is Inetd, and how to get Mail/News

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-13 00:00:00 UTC
From: ali@birnie.demon.co.uk
Message-ID: <40l10q$ig@birnie.demon.co.uk>
Source record: 24982

Mario Becroft (mbecroft@iconz.co.nz) wrote:
: First, what is the programme INetd? Do I need this to use Talk?

Inetd is the internet `super server'. It is usually started up as part
of your start-up script. It opens a socket and listens on _all_ ports
it is configured for (in inetd.conf) and when a request comes in for
any particular service, inetd launches the correct daemon to deal
with that request, be it FTP, telnet, smtp or whathaveyou. This save
you having loads of different servers all listening on their respective
ports, and gobbling up your memory and your cycles.

: Second, I am quite confused about what software I need to recieve and
: send email with MiNTNet. Normally, I call my host with a VT100 terminal,
: and run Pine on my host's computer. Normally, my inbox is located in
: /ver/spool/mail/mbecroft. Do I have to FTP this inbox to my computer and
: then look at it with Elm every time I want to se my mail? Can't I just
: make elm look at my mail directly from my host? Also, if I can look at it
: directly, without FTPing my inbox first, will it read the entire inbox?
: i.e., say I have a 200K inbox. The message I want to read is only 2K. Do
: I still need to get the entire inbox just to read the one message?

I think this sounds a bit confused. When you open an account with a
service provider such as demon, you will be given a hostname for
your m/c, say, bloggy, and a domain name, say, demon.co.uk.
Your address then becomes bloggy.demon.co.uk and you can have any
number of mail slots on your m/c like mario@bloggy.demon.co.uk or
ladyfriend@bloggy.demon.co.uk. Any incoming mail bound for bloggy
will be stored somewhere on the server's m/cs. You needn't know where
and you need not care. As soon as you log onto your provider, if there
is mail waiting a request for service will be made on port 25. Inetd
will be listening and will know from the port number (and /etc/services)
that this is a request for an smtp daemon and will start up sendmail
or smail or some such. smtpd(smail/sendmail) will dialogue with the
remote server and transfer tour mail into your spool directory, say
/usr/spool/mail/mario. There it will wait until you next run elm, when
it will appear before your eyes. (hopefully).

: Also, I naturally want to see Usenet through MiNTNet? Again, I know
: nothing about how this works, so what programmes do I need, and how do I
: set them up?

Usenet it another ball-game alltogether. I have tried in vain to obtain
some help in finding out what is available for MiNT in this area, and
came to the concusion that the answer was zilch. Up till now that is.
If you can read this posting, it means that I am well on the way to
finishing a port of inn, nntp and tin to Mint. It's looking pretty

good at the moment.

Drop me an e-mail if you need further details on setting up Mail/News
on MiNT.

regards.

: Are you sure you had "AHDI Compatible" ticked on when formatting with
: ICD-pro?

Hmmm.... Weird problems around, Save Our Souls ;-) ! I lost some hair
while trying to install MinixFS (the latest version at CNAM ftp site),
too... First, minit didn't accept all the parameters needed at all.
Minit -V H: produced some kind of a Minix partition, but (surprise..) the
checking program of the same archive (don't remember the name, sorry)
didn't recognize that damn 30 MB partition as a Minix partition at all!!
Still, it works like one. Almost... Last time I used it, I got lots of
garbage after copying files into that partition.

Setup: Falcon, TOS 4.04, HDDriver, MinixFS 0.6xxx, MiNT 1.08 and 1.12.4
(FreeMint). Is there some trick I don't know, I wonder...

=(

The Lexicor Software support site is now at:

sgi.lexicor.com /pub/atari/3D2

the Lexicor url is: http://world.std.com/~Lexicor

We've been doing some changes, we apologise for any inconvenience it may have
caused.

Thank you

I can't recall if this has been discussed earlier (yes?): Can a standard (Atari) Falcon be equipped with the C-Lab parts (audio upgrade etc.)? I'd be at least interested in getting new DA converters (for eight channels if possible [that's no more C-Lab stuff]).

Are the Toad Computers on the Net? Or any other Falcon gadget & device dealers? If you're a Falcon hardware thingies dealer, please stick your advertisements or WWW addresses into my e-mail box:

Lauri.Nuuja@Helsinki.FI

Reasonably new releases of `tcsh' for MiNT all have the necessary
hacks for "#!" emulation (as long as the script you're trying to
execute has executable permission bits set, of course).

Try <URL:ftp://ftp.inf.tu-dresden.de/pub/atari/Mint/Shell/tcsh6033.zoo>,
or, if you are don't mind a beta test release (for which I hadn't had
time to support it properly),
<URL:ftp://ftp.inf.tu-dresden.de/pub/atari/.Dev/tcsh6051.zoo>.

I don't think the 2A is capable of what you want it to do.

According to my manual it will do horizontal 31.5kHz and 35kHz, vertical
56Hz/60Hz/70Hz NI.

> The NEC does work with monochrome 640x400 just fine (I'm using it

The MultiSync II and 3A will however do all 3 Atari resolutions fine with
the aid of the suitable switcher box/lead.

___Read the docs.____
SOL only works (according to what the author says) in UP TO 256 colours.

SOL works extremely fast (about 5 or 10 x faster than photochrome and probably about 4 or 5 x faster than Imagecopy]I[ ) and has a huge amount of options.

The only prob is that I find it wont work in 16 colours at 320x200 on my MegaSTE Tos2.05, 50 meg HD......and my machine is the same as the programmer's!!!

Skip.

Hello,

I'm pondering the purchase of an Atari Falcon (basic config.). The seller asks $1000; do I only think that's high, or is it, indeed?

I might soup it up, and do direct-to-HD audio recording in the future with Cubase Audio on it (if I don't get a good deal on a digital multitrack tape recorder... :-)

There are C-Lab MkII Falcons, too, on the market, especially built for the purpose of HD recording. C-Lab reportedly "cleaned up the audio circuits", etc. etc... should I refer from buying a plain vanilla Falcon, then? Did anyone compare the two units?

> or something. ;^)

I bought one on a Computer Show here in Dortmund a few month ago. A dutch
vendor sold the collected rest of former european Atari departments. I payed
DM 150.-- for it, that are about $110. It came without harddisk and keyboard.

The ATW800 is divided in to parts, the T800 Transputerboard and an IO-Host,
a Mega-ST-like board. Because the tower-case is very nice and stable, I plugged
my PAK3 on it, added a Quantum ELS 85 and a Quantum Lightning 540, installed
Linux68k and I am happy that I made that good deal :-)).

The tcsh must be linked with the Mintlibs.

>BTW, I keep coming up against this UNIXMODE chap, and know nothing about
>it (I am new to this stuff). Where can I find some info about it?
>It was set to /cub, I tried /cubs but it made no difference.

There're some docs somewhere, I forget where precisely. Mintlibs don't
support much of the UNIXMODE stuff. Here's the relevant code from
main.c which checks UNIXMODE:

```
-----
/*
* initialize UNIXMODE stuff. Note that this library supports only
* a few of the UNIXMODE variables, namely "b" (binary mode default)
* and "r<c>" (default root directory).
*/
if ((s = getenv("UNIXMODE")) != 0) {
while (*s) {
if (*s == 'b')
__default_mode__ = _IOBIN;
else if (*s == 'r' && s[1])
_rootdir = *++s;
else if (*s == '.' && s[1])
s++; /* ignore */
s++;
}
}
```

---
spawn.c also checks UNIXMODE for 's' and does the hash-bang emulation
if it exists.

If you wan't a new Falcon for your purposes than you should bye a
C-Lab Falcon MK-I. The MK-I is new, the only difference between the MK-I and
the MK-II is that the MK-I has "only" 4 MB Ram and no built-in harddisk
(you can fit one though, as with the "normal" Falcon030).

The MK-I costs about the same as a new Falcon030 with 4 MB no HDD.
So for your requirements the MK-I should be a good buy, since the
audio circuits are indeed better.

Toad Computers has the Falcon MK-II and Falcon MK-I, as far as I know.

Hope this helps..

Keep Cool and Flying...

ChainXOR..

3331. Memory hungry programs & MagiC

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-15 00:00:00 UTC
From: wongck@ti.com
Message-ID: <wongck.248.00091265@ti.com>
Source record: 24900

Some programs which I use seems not to be releasing memory back to the MagiC kernel after it finished executing. One such program is Pure C compiler which I use very frequent. Is there any way of making the program release the memory back to the kernel other than rebooting? It is getting to be a pain as my debug/compile cycle is now only 5 or 6 times before I need to reboot the ST to reclaim the lost memory.

Regards
William

Hi, George!

VerySmooth (verysmooth@aol.com) wrote:
: Hello,

: I'm pondering the purchase of an Atari Falcon (basic config.). The seller
: asks $1000; do I only think that's high, or is it, indeed?

Hmmm ... the going rate for a used Falcon with 85 Meg hard drive with
standard Atari-supplied software is about $750.00 in San Diego (monitor
extra). If that $1000 includes a hard drive, a good monitor, and some
aftermarket software, it may very well be a good deal.

: I might soup it up, and do direct-to-HD audio recording in the future with
: Cubase Audio on it (if I don't get a good deal on a digital multitrack
: tape recorder... :-)

: There are C-Lab MkII Falcons, too, on the market, especially built for the
: purpose of HD recording. C-Lab reportedly "cleaned up the audio circuits",
: etc. etc... should I refer from buying a plain vanilla Falcon, then? Did
: anyone compare the two units?

I heard that C-Lab also specified a hard drive with heavy-duty heads
that won't overheat during intensive Direct to Disc recording sessions.
But I can't remember where I heard it.

Source record: 24902

Hi, here is a list of the hardware I have available for trading
for a Hard disk drive (Atari of course), any offerings just E-mail me at
kturner@spock.byu.edu :

Atari 520st : 500k RAM, perfect condition, with external power
supply (great for Terminal emulator).
Disk Drive SF 354: with power supply (1 DD)
Mouse : Original Atari Mouse.
SC 1224 Color Monitor: OK
Joysitck Suncom : White, large.

Atari 520 ST fm : This one has been upgraded to 1 MB RAM and has
an original RF Modulator (can be connected to any
TV), the tab button is lost; the built in Disk
Drive (1DD) is quite out of alignment, but
works with the Disks formatted using it.

All cables supplied. I give away a Citoh Printer with them.

3334. ftp.std.com/pub/atari ? Does it exist anymore?

Well, I see BRASOFT has come out with a new version of Gemulator. Version 4.0 works with Windows 95 and is now STe compatible. It looks snazzier and sounds snazzier, but, it still won't read copy protected disks. That means I can't play The Pawn, Dungeon Master, Barbarian, Chaos Strikes Back or any of my other favorites. Does any one know of a way to copy disks over without the protection? Has anyone ever been able to get any of the mentioned games to run on Gemulator, and, if so, how? Any help would be greatly appreciated. Thanks in advance.

Sincerely,
- Byron Followell

>>any docs. Perihelion can still sell the Helios software for about 800 pounds

>So where is it possible to get your hands on an ATW and how much does it cost
>these days? Just curious - might want to have one and solder it onto my M4STe
>or something. ;^)

ACN in the Netherlands probably still can sell them.
ATW800 system (1 Inmos T800) + keyboard = 599,- guilders
MEGA ST I/O system = 599,-
Farmcard (4 Inmos T800) = 599,0

The MEGA ST board is modified to be able to communicate with a transputer. So
it contains a Morpheus chip (Atari custom DMA chip ??) which controlls the
Inmos C012 comminucation chip, the NCR5380 SCSI chip and some signals for the
diagnostic bus.

You can create some additional hardware to your M4STe to control the
transputers, but that will be quite difficult, I think.

Greetings,
Ids.

: Reasonably new releases of `tcsh' for MiNT all have the necessary
: hacks for "#!" emulation (as long as the script you're trying to
: execute has executable permission bits set, of course).

Yes, that's fine. I got tcsh 6.03, and it does the hashbang OK.
Regarding the need for setting the UNIXMODE 's', this appears to
be unnecessary, as tcsh certainly does the #! without it.
I'd get rid of the UNIXMODE variable completely, only gcc seems
to need something there. I just hate having stuff in my environment
if I don't understand what it's for.

thanks.

I'm using the NEC Multisync II. I'm currently using it on the PC, but it works fine with the Falcon, too. It also works with an ST, but it's a little tricky to make good cable for it, as the ST video port does not have separate grounds for red, green & blue signals. I've made a cable for connecting an ST to the NEC, but as the separate grounds are all connected in one, the picture is not too good. There must be a better way of making this cable, but I won't bother as I don't really need to use the NEC with my ST. The NEC MultiSync II doesn't quite have the sharpest picture, but it syncs down to video freqs, has a bright picture and a good contrast. The best thing about mine is that I got it practically for free!

Yes, but, if you read his product literature it says it will run
90-95% of all Atari software. I think games make up about 75-80% of
the ST's library. So, where's that figure come from. Also, it doesn't
say it won't run games or that it will only run gem software anywhere.
All it says is that it won't run copy protected software. So, if there
was a way to make a workable, unprotected copy of say, Dungeon Master
on a non-twisted, normally formatted disk, then it should run. That's
the reason for my question. So, from now on, if no one has an answer,
please don't respond. Thank you.

Sincerely,
- Byron Followell

And I dont for one minute expect it's that bird 33,000 miles up!

Back in the days when I used nos, any mail arriving was signalled
by a message on the screen saying "New mail for xxxx" and a cheerful
little "Ping".

I noticed while building smail that it uses a function named
notify_comsat and wondered if this should perform a similar duty.
Whoever did the initial Config for MiNT included the def HAVE_COMSAT.
The notify_comsat function is being called, but as yet I have been unable
to deduce what it should do.

Can anyone shed some light on this subject?

regards.

LTN>[that's no more C-Lab stuff]).

First: C-Lab uses the same D/A and A/D converters as Atari did.

You can get a SoundLifter from Catch Computer in Aachen, Germany - that
replaces the whole analog audio part and gives you 6 Chinch connectors - 4
input and 2 output - with line level and a much better sound than the
original falcon. You will have to de-solder the old codec (or buy a new one
and leave the old in the main PCB) in order to install SoundLifter.

I do not know of any SCSI disk drive that would 'overheat' during heavy data transfer - those drives would fail much earlier when used in heavy-loaded unix systems (eg. news servers) - harddisk recording requires a steady data stream, but nothing very demanding from the drive mechanics or electronics.

: my venerable SC1224...

: And on the subject, anybody know what multisync monitors are still being
: made and/or available new in the U.S. that will sync to ST video like the
: old NECs and Mitsubishis can?

: ---Alex
Oops... My mistake, I was thinking of the II's instead of the 2A's, even
though the original question was for 2A's. As someone stated the 2A's only
go down to 31.5 Khz, & 35K just enough for VGA. The II's did go down to 15K
besides 31 & 35K. As far as connections, if you can solder the cable, then
these pinouts should be all you need for the NEC II, not 2A: it's 9 pin
con. is: pin 1 Red
pin 2 Green
pin 3 Blue
pin 4 H Sync
pin 5 V Sync
pin 6 R. Ground
pin 7 G. Grd.
pin 8 B. Grd.
pin 9 Ground
The 2A has 15 pin conn. w/different pinout.
The 3D is also able to go as low as 15K, has the best video bandwith of the
3 mentioned. It has the same pinout for 15 Pin VGA conn. as the 2A.

As far as new monitors that go that low, I would be interested in knowing
too. I would suppose NEC might sell the 3D as a refurb, but that's a guess.
The only other models that I can think of for Multisync choices would be the
Mitusbishi AUM-1381A, AUM-1371A , A.O.C CM-314, & ACER 7015. I'm sure there
are many more I haven't mentioned, but these are the more common ones that
you might find used, along with the NECII (not 2A), or 3D. The Mitsu.
monitors have the added benefit of having a Composite video input, great for
plugging a VCR into, but no built in audio. Oh, one more is (kinda obscure,

AFAIK) is Magnavox 8CM873-0741 (say MultiMode Display on the front) this will go up to VGA, but also goes down to 15K, and has mono audio w/speaker. The reason the older one's go down to 15K is back then, they had CGA @15K, EGA @22K, MDA @18K,PGC@ 30.5, and VGA @31.5, later came 35K SVGA, and 1024 NI requires 48 Khz, while Interlaced needs just 35K. Larger than 14" screens go even even higher on horizontal scan rates. All an ST needs is 15K, analog inputs, & separate H & V sync, with the correct ground connections. There are plenty of old 15K only color monitors many made by NAP/Maganvox that can work on an ST, but you have to provide the connections/cable. Some need composite sync, not all ST's have this available, hence it's better to find one that can take sep. H & V sync. All the old Amiga monitors are possiblities, too, not to mention the Msync models made for the later Amiga's that could do VGA and/or 15K... Dan Valega (valega@qns.com)

3352. searching for address of pak developer

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-18 00:00:00 UTC
From: harbaum@evix2.dwhl.de
Message-ID: <411m69$nor@com1.dwhl.de>
Source record: 24921

Hi!
I am going to design a graphics card that fits on top of a PAK030 or
FRAK and uses the 68030s 32 bit bus. Therefor i'am needing the mail
address of one or more of the PAK/FRAK developers.

Hope someone can help me,
Ciao,
Till

3353. Wanted: D-50 bank structure info / Dr.T email address

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-18 00:00:00 UTC
From: kruisweg@flatearth.xs4all.nl
Message-ID: <081895153141Rnf0.79b6@flatearth.xs4all.nl>
Source record: 24922
Cross-posted to:
rec.music.makers.synth,alt.music.midi,fidonet.midi-programming,fidonet.midi-net,comp.sys.atari.st,comp.sys.atari.st.tech

I've recently got a large number of Roland D-50 banks. The only problem is
that I've got at least half a dozen incompatible formats. For some of these
banks I don't even have a loader program. I'm thinking of writing a program
(Windows, maybe Atari ST) to convert all these different formats to at least
Dr.T and Synthworks, maybe others too if I get enough info.

Before I can start I have to find out the structure of all these formats. Who
has more info on the following D50 bank formats.

```
Ext Filesize
-----------------------------------------------------------------
*.D50 34688 (Dr.T, Atari, PC, Amiga, etc.)
*.BNK 70100 (Atari program: BANKLOAD.PRG)
*.MEX 36048 (Atari program, distributed by Dutch music store)
*.D50 34690
*.DMP 36048 (Mac sys ex dump?)
*.D50 49152 (Atari program: D50DUMP.PRG)
```

If you have banks in other formats, D-50 editors (PC, Amiga, ST), (email)
addresses of MIDI software publishers that have made software for the Roland
D-50, other useful information, please send it to me. I've already contacted
Steinberg, the address I need most now is that of Dr.T. Do they have an email
address? I also need a more recent email address of the author of the Atari
ST program MT32-D5-D10-D110-D50 Explorer, because the email address in the
README.TXT bounced.

: L.J.Sak@kub.nl

Yes, it does work, but why??? I mean I bought my Falcon for its advanced features and new GEM environment. MagiC for ST's can be made to work, but all you get is a computer that works like a fast ST in monochrome mode and multitasking. All Falcon specific accesses and features do not exist in MagiC 2.x. So you lose all Xbios DSP calls, Falcon specific 16bit and sample rate Xbios support, 3D GEM support, screen modes (other than ST specific) support, etc. It is essentially giving you a Multitasking ST with a pseudo "PAK" board (because of the Falcon's 68030).

Wait for the real MagiC for Falcon. Don't bother with patching something that was never intended for the Falcon.

Don't get me wrong, I miss my Mag!X OS terribly, but I miss my Falcon's capabilities even more than that.

Rich

3355. Re: objc_draw() redirection?

>to "trick" objc_draw() to direct its VDI calls to another workstation...?

AFAIK, the AES opens it's own VDI workstation to do any drawing. The handle
of this workstation is what is returned with graf_handle().

As the the workstation is already open, I doubt that you could redirect it
to another handle. The only way that may be possible is by altering the
value of the handle, which I _think_ is stored in the negative-offset LineA
structures. This seems very dodgy though. I doubt it would be compatable
across all TOSes.

On the subject of EdDI and offscreen bitmaps, I'm trying to use NVDI to do
this, with v_opnbm() etc. Unfortunately, I only have the German NVDI
programmer's guide, and I don't speak German, so it's all a bit hit and
miss. I would be grateful if someone could mail or post some sample code
that opens an offscreen bitmap and draws on it, as I keep getting memory
protection errors from MagiC when I try it.

As for EdDI, am I right in thinking that this is a freeware (?) program that
allows you to use NVDI's offscreen bitmap facilities, without NVDI?
If so, where can I get it from, as it doesn't seem to be on the usual FTP
sites.

Thanks for any help,

What I've heard is that the D/A converters in Falcon are actually
quite good - problem is the analog part and it's isolating.

>You can get a SoundLifter from Catch Computer in Aachen, Germany - that
>replaces the whole analog audio part and gives you 6 Chinch connectors - 4

Just what I need. Anyone know Catch Computer's FAX number etc. ??
Do they sell codecs, too?

3360. prob w/Falcon/SM124 - HELP!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-19 00:00:00 UTC
From: John Hechtman <johnhechtman@delphi.com>
Message-ID: <BjKjT25.johnhechtman@delphi.com>
Source record: 24929

This is a repost as the first one got horribly mangled in the upload and I've also gained some information since the original post. But my question still remains - what could cause the "shimmy" I describe and how could it be fixed?

I just recently set up our new (well, almost new) Falcon and hooked it up to our trusty SM124 mono monitor. The good news is that Notator Logic and the Falcon get along great (grin). The bad news is that there seems to be a lot of noise on the SM124 picture. There are also some faintly visible vertical bars on the screen that "shimmy" when any drive is accessed. I got the VGA to SM124 adaptor from Toad and tried the snap-on ferrite bead noise filter that comes with the adaptor, but the problem persists.

My question is, is this normal using the SM124 on the Falcon? I got a less noisy picture with _no_ vertical bars or "shimmy" when it was hooked up to the old 1040STe. Why should I get _worse_ picture quality with the Falcon?

I talked to Steve Cohen of Wizztronics and he said that it might be caused by a bad PSU in the Falcon - he says that anything less then 4.8vdc on the 5v supply indicates a bad PSU and that will pull down the video. Does this sound plausible? I've tried it with _2_ different SM124's and the vertical bars and "shimmy" appear on both. I've also tried relocating the monitor and having it as far away from the cpu as the video cord will reach and I still get the $#@! lines/shimmy! I've also talked to 2 people who have used SM124's or equivalent with the Falcon and they had no problems. I'm a tech and I'll open the Falcon Sunday to have a look at the PSU. What else could cause a symptom such as I describe?

I'd like to hear from anyone who's used the SM124/Falcon combo. Tell me what kind of picture quality to expect. Would a VGA monitor solve the problem? I want to make sure I _have_ a real problem before I start busting the chops of the guy who sold me the Falcon ;)

Thanks in advance to all who reply! It would be especially helpful to direct your information to my Internet address as I am posting this to a number of places to get the broadest possible response. Post replies to: "johnhechtman@delphi.com". And extra thanks to those who already replied, you've helped me make better judgements by sharing your experiences!

I use my serial port to run a microsoft mouse or my tablet. I got the mouse driver from CyRel/Cybercube in toronto, ontario, canada. the mouse driver part is excellent, but the tablet driver only has relative positioning, no absolute positioning which means if you are tracing something with your tablet pen, that you can't lift the pen up, as you will lose your position vis-a-vis the screen/tablet. I can't use my serial port also, but I donb;t really ewant to be online while I am drawing.
Advantage: allows you to use the atari OR serial(Microsoft) mouse. both are usable.
hope this helps
take care.fait attention

From: macdonald@cfcsc.dnd.ca
Message-ID: <macdonald.246.000F7B13@cfcsc.dnd.ca>
Source record: 24933

just recently someone asked if I knew how to set the scsi id on a megafile.
well the megafile documentation tells you how to do it on the magefile case,
but if you remove the syquest from the case you might be stuck :^)
here's what i've dug up:
looking at the back of the syquest

power : : : : : :
supply
P T C B A
P=parity
T=test
C=4
B=2
A=1
if A is jumpered (second from the right) then you have a scsi id of 1,
if A and B then a scsi id of 3, etc
if anyone sees anything wriong with this don't hesitate in letting us know.

To make use of Multitasking! That's the reason why i make use of Magic
on my Falcon and i love it. I'm a programmer and i don't miss 3-d buttons,
DSP chip and sample support but i love the speed and the flexibility of
Magic. Although it's a patched version but i don't want to wait until ASH
does have Magic for the Falcon ready.

The screen modes are limited but i'm allways using 2 colors and blowup
and screenblaster are supported so i don't miss anything.

> Multitasking ST with a pseudo "PAK" board (because of the Falcon's
> 68030).

Okay, but i don't have my Falcon to make not use of Multitasking when
possible.

> Wait for the real MagiC for Falcon. Don't bother with patching something
> that was never intended for the Falcon.

I hope this version will come out soon.

> Don't get me wrong, I miss my Mag!X OS terribly, but I miss my Falcon's
> capabilities even more than that.

No, i'm not but this is pure personal teaste :-)

MultiTos may be more give the possibilitys of the Falcon OS but it's
terrible slow to use and Magic is the mirrored of that, it's fast and
you'll get the look that you did buy a new and accelerated computer :-)

Greetings,
Koos

It does work: GREAT!!!!! Wooww!!! Extremely fast and the 3-d buttons are finaly gone because i don't like this extra's.

I use it now for a month and i'm allways working under Magic now on my Falcon. There are a few limits but that doesn't matter, it works!

Okay, DSP support isn't there and also not all screen modes but i don't need that so, what i need was multitasking. My ST can do it and my Falcon too!

Greetings,
Koos

I don't know but on my Falcon it was very dangerous to start programms
using ALT-E and ALT-D (debugger). Go back to the desktop with CTRL-Q
and put the PureC and Debugger under function keys and start them from
the desk. This does solve a lot troubles on a Falcon.

ALT-D seems to do not work correctly but on my ST i've never had problems.

3369. My Falcon's keyboard is dieing!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-20 00:00:00 UTC
From: Timothy Miller <millert@csee.usf.edu>
Message-ID: <Pine.SUN.3.91.950820010719.10049B-100000@grad>
Source record: 24934
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I need some advice on fixing my Falcon's keyboard. The $85 replacement is NOT an option, since I simply don't have the money to waste.

What's happening is that keys, especially the 'E' key, simply don't respond some times when I press them. I have had the keyboard apart a few times since it started dying on me, trying to fix individual keys. Recently, I discovered that the cup for the E key was torn up. So what I did was sew (with needle and thread) the cup back together, and then switched it with the cup for th Clr/Home key. Ironically, the Clr/Home key works just fine, while the 'E' key with the new cup is not functioning properly. Plus, I am having problems with other keys not responding properly either.

Now, I can either try to fix the problem, if anyone has any suggestions, or I can replace the keyboard from one in a 1040 that has since died with a salvageable keyboard.

Please respond to me in email at millert@grad.csee.usf.edu, because if you post to the newsgroup, I will NOT get your reply.

Thank you.

Yeah, well, sometimes you'll just have to pay a price for a replacement
part in order to get your system running again.
Deal with it, nothing comes for free.

The keys are connected through a matrix; if you also have trouble with
S, X, D, W, 3, 2, F5 (column) or [control], Q, T, G, I, P, etc. (row)
(some or all keys) possibly a trace on the PCB is broken (or a wire)

I have an old (late 80's) Supra 20 meg hard drive that after a long warmup works fine. The problem is by long I mean an hour or two or sometimes longer. It won't boot up, just clicks a couple times. After the delay, a reset boots it right up. I'm guessing it is probably a power supply problem. Does anyone have any hints to give me? Thanks

Jim Kajpust - Personal Freedoms - Michigan

You have to keep in mind SoL was originally designed to use a flickerdraw
technique to make GIF's look good in ST/e lowres. If you have a CrazyDots card,

what the heck do you need SoL for? :)

You have a falcon with only 1 serial port??? Funny thing, that. Mine has 2.
(Ok, it really has 3, but most falcons have 2, I suppose.)

Hello!!! Hello!!! Anyone in there?? The message clearly asked if the
mouse worked on a FALCON. The Falcon has TWO serial ports. One is the
MODEM port and the other is the NETWORK port. Using the NETWORK port is
the most preferred for serial mice.

STILL not reading the entire message before replying (stupidly) again eh?

Rich

In the mean time, why don't you try out MGIF v5? It's much faster at GIF
loading than SoL (in fact, there is no faster program anywhere that I'm
aware of) and runs _very_ nicely in Falcon TC (it works in every other
ST/TT/Falcon mode and on 8 bit cards as well).
For GIF saving and JPEG loading with no or primitive colour quantization
SoL can be quite a bit faster. For greyscale or advanced col. quant JPEG
load, the two programs are more alike.
MGIF loads GIF/JPEG/Targa/PPM/(X)IMG/PI? and writes GIF/Targa/PPM/IMG.

(I posted an article to c.s.a.announce some time ago, but it seems like
it never appeared for some reason. See below for a WWW/ftp site where
the same info can be had.)

SoL and MGIF are very different in their approaches to image processing,
so if you're into that you really should try both.
There is not much of image warping in MGIF (scaling and rotation to any
angle is about it), but it's got more filter functionality and the ability
to manipulate and view 24 bit images.

It should be said that MGIF will not do any kind of palette/flicker
trickery to improve displaying except on monochrome screens. In greyscales
or in high res 16 colour modes, very good results can be had, though.
256 colours modes and Falcon TC normally look very nice indeed.

The current version of MGIF is 5.00beta and until the final release it's
only available on the WWW/ftp site mentioned my the .signature. If you
have any kind of Web access (Lynx is quite nice for text terminals), I'd
recommend that.
I'd very much like to hear any comments from those who try out v5.00beta.

Finally, MGIF is FreeWare so there's no crippling of any kind. The full
source code is available on request for use in other FreeWare (and
similar) programs.

As of Monday 21/8/95 OASIS 1.30E has been uploaded to the Demon and Hensa FTP sites.

Two files have been uploaded.

OASIS130.TOS is a complete version of OASIS for people who have either never installed OASIS before or who have a version of OASIS below 1.20E.

UPD_130.TOS is the files that have changed from version 1.20E for those who have already installed 1.20E.

Oh pull that crowbar out of your ass. If you woud have looked at the return address, then you would have noticed that it comes from a university. How many times have yu found yourself able to spend lots of time searching through news articles every day in hopes of finding what you need and have time for school-work?? It's much easier to check to see if you have mail and immediately print it out and get on with your busy day.

Besides, if you would have read his entire message BEFORE forwarding to a Newsgroup, then your reply would have been MAILed, because you would have known you needed to send an Email REPLY.

Geez!

Rich

3383. Broken HD or Falcon?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-21 00:00:00 UTC
From: artoj@mits.mdata.fi
Message-ID: <41aqeg$dau@news.mdata.fi>
Source record: 24852

Just recently my HD started acting strangely. When I opened
one directory, it showed just some garbage in it. Well, I
reseted the machine, and Falcon couldn't find the whole
HD at all (AHDI wasn't loaded, instead disk drive was used).
I managed to get the AHDI running again after keeping the
Falcon closed for awhile (to cool it down).. Then, several
hours later it worked again, but after a minute of use
(approximately) the HD went nuts again. Only garbage was
displayed in the directories, and after resetting
(or switching off) Falcon didn't find the HD.

I opened the machine and looked if the HD was well in place
and it was.

I don't know if the fault is in Falcon or the HD.
If anyone knows what might be wrong, please tell me!
I've got some important stuff in that HD

Now I have to use this bloody PC, so you know how
desperate I am! (it scares the hell out of me
thinking that I might be stuck with PC the rest
of my life! :-)

Regards,
Arto Jalkanen

APCTC> Well, what do you use? GEM-view? :>

For Falcons, nothing beats the APEX viewers.

APCTC> SOL was very good, except that it only did one JPEG per run on the
APCTC> unregistered copy, and it didn't use the DSP, and it doesn't run in
APCTC> True Color. When he makes a Falcon verison, I'll register it.

SOL _does_ use the DSP, though it doesn't support true color. To use the DSP you need to put Atari/BrainStorm's JPEGD.TTP in your AUTO folder. (Other programs, such as Imagecopy, also use this.)

As for the one JPEG per run on the unregistered version, I see nothing wrong with that. Unfortunately, a lot of people won't register a program unless there are limitations placed on unregistered copies.

interesting FAQ, and advert :^)

>***SECTION 10: IOMEGA ZIP vs SYQUEST EZ135
>SyQuest has released a new drive called the "EZ135" (formerly known by
>its code name, "Roadrunner"). This drive costs ~$230 for an external
>version (~$200 for an internal version) and uses ~$25 cartridges that
>store 135-MB each. EZ135 weighs about 2 lbs (twice as much as the
>diet-conscious Zip), but is also about twice as fast.
>There are many mixed messages about which drive will ultimately prevail.
>However, I personally feel that the Zip drive will be the winner for
>several reasons. Here's why:

>* The Zip drive is cheaper. Zip costs $200 for external, while EZ135 is
>~$30 more.
for a measly $30 you get twice the speed and an extra 30MB. How
can the ZIP compete with that?
Furthermore, the Zip drive is now available
internally from >Power Computing and soon as an end-user installation kit, and
chances are >it will cost considerably less than the EZ135's internal price of
$200.>* Zip cartridges are smaller, lighter, and more transportable. EZ135's
>cartridges need to be stored in the same sort of padded carrying case as
>"standard" SyQuest cartridges, making then considerably more bulky to
>transport. As a result, you'll likely see less of them being used with
>portable computers and, consequently, with desktop machines.>* Zip already
has a substantial market lead over SyQuest. Historically >speaking, the Mac
market hasn't had much in the way of brand-loyalty. >SyQuest drives became the
predominant standard not because of any >outstanding features, but simply
because they were cheap in comparison to >the more expensive Bernoulli drives.
Similarly, the Zip is cheaper than >EZ135.
but if people compare the speed, storage space? an extra 300MB per 10 disks is
nothing to sneeze at!
>* The Zip is being offered as optional equipment in
Power Computing's Mac >clones (and hopefully -- eventually -- Apple's own
products), whereas the >EZ135 is not. This has the potential to give the Zip
drive an even larger >market share.
>* Though EZ135 is faster, Zip is already fast enough for the majority of
>users. QuickTime movies, sound files, and similar time-intensive files
>play just fine from Zip. Only a comparatively few users will actually
>_need_ the additional speed that EZ135 offers, and when you consider this
>in relation to everything else, the EZ135's speed becomes a
>not-so-important factor.

what 'everything else'? people may not _need_ the speed, but I think they will
want it :^)
>* EZ135 cartridges hold about 30-MB more data after formatting,
true, but >is that enough to justify a more expensive, heavier drive?
I generally don't walk around with my drives :^)
I don't think >so. Again, the fact that the Zip is so easily transportable
makes it the >better drive, regardless of the data storage capacity. If
SyQuest's new >drive were to hold, say, 200-MB or more it would be a
considerably >different story.
>* People may be angry at SyQuest for "holding out" on the community. More
>than a few users have wondered out loud why SyQuest didn't introduce the
>EZ135 before Zip came on the scene. The most logical answer is that
>SyQuest was making so much money off its other, lower-capacity drives
lower capacity? only the 5-1/4" 44MB and 88MB, everything else is over 100MB

>that they didn't want to rock the boat by introducing the EZ135. Only
>when Iomega started severely cutting into SyQuest's market did SyQuest
>respond with the EZ135. In short, it seems that SyQuest was more
>interested in lining its own pockets instead of advancing the technology.
>While this is probably good for business, it doesn't make the users any
>happier.
"more than a few users"? I haven't heard ANY users even mention it, quite
frankly.

>It's ultimately a simple matter of time deciding which drive will
>prevail, but if I had to place money on the outcome, I'd bet on Zip.
let me guess. you own stock :^)

Most software has original boxes and documentation.
All software are original disks, not back-ups or copies.
Some of the hardware also has the boxes that they came in,
but some do not, such as the hard drives, disk drives for parts,
1040 case and RF shield, etc.

All prices are in US Dollars and do not include Shipping costs.
All prices are negotiable and open to reasonable offers.
Payment by personal check will be shipped after the check clears
my bank, aprox. 5 working days. Payments by money orders will be
shipped the day after payment is received.
Priority will be given to orders of 5 or more items.
This list current as of: 8/20/95

Item Name starting with (P) is possibly sold, in negotiations,
or awaiting payment.

: my internal 85 Mb to a somewhat larger one?
: How long is the length of cable allowed to function properly?
:
: Ludo Sak,
: L.J.Sak@kub.nl

I have recently changed the 85 meg IDE drive in a Falcon to a 256 meg.
Have you considered this may be a lot easier to keep the 2.5 inch size?
You can swap them over in about 10 minutes.

If you do wish to go to a 3.5 inch drive, you need a 2.5 to 3.5 inch IDE
data adaptor. Try computer stores locally or you can get them from

Arrowfield International
2822c Walnut Avenue
Tustin
California 92680
TEL: +1 714 669 0101
FAX: +1 714 669 0526

Maybe about $15 U.S. including postage.

Preferred yes, easily done NO.
Show me a mousedriver please that supports the _network_ port...

>STILL not reading the entire message before replying (stupidly) again eh?

COOL it DOWN Rich, I always read whole messages before replying. To this one
I answered in a general matter so that it is applicable to all Atari's.
There's nothing wrong with that, and people who _do_ own a Falcon (LIKE ME)
know perfectly well that it has two serial ports (well, four, actually;
MIDI too, and the DSP port uses serial communication too...)
but only one is a *RS232* port. If someone wants to write drivers and solder
an adapterwire (lots of fun with those *#&%#&^&$ miniDIN-8 plugs) that's
their problem. I only stated that *most users here* have *one* serial port.
Now, as falconowners are not a majority in this group, this figures perfectly.
What gives you the bleedin' right to start yelling and insulting ?
Try and learn to read first, Okay ? Please re-read my post carefully and
tell me where exactly I said Falcons have 1 serialport ? Huh ?

And about that defective-keyboard-post... It's a matter of politeness to stay
in the group to read your expected answers. _I_ have to read a daily feed of
over 400 KB just to keep up with new developments and technologies

AND to *help* other people.
My time is probably even considerably more precious than that of someone with an .edu address (which can be anyone really), as I run a whole computercompany just by myself. And, yes, I did read the whole post before replying, this decision was completely _on purpose_.
The original poster would have had no trouble from me, had he stated he rather _preferred_ email. But no, he said "I will not get your reply if you post to this group". Nasty.

Consider this situation :
You are a student somewhere and you ask a fellowstudent for a favor.
This other student looks at the math-problem you present him and says: "Yeah, let's sit down for a minute, I'll completely explain and solve this problem for you" But you reply: "Naaah, my time is too precious to waste it on that problem, just solve it, write it all down, put it in an envelope and mail it to me, will you ? That would be convenient for me."

So what would _you_ do then, huh ?

AJ> and it was.
AJ>
AJ> I don't know if the fault is in Falcon or the HD.
AJ> If anyone knows what might be wrong, please tell me!
AJ> I've got some important stuff in that HD

Check that the power leads to the drive are secure.

Check the data cable from HD to Falcon is secure.

Check that any socketed chips are properly seated.

Use the floppy copy of your disc utilities to re-install the driver.

If none of this works you probably have trouble in the HD itself. Have you
any diagnostic programs you could run? Otherwise the cheapest way to locate
the fault would be to temporarily substitute another drive but you would
need a GOOD friend to allow you to borrow his HD!

3396. parallel port configuration

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-22 00:00:00 UTC
From: fsctc@lerc.nasa.gov
Message-ID: <41e2k5$bg6@flame.lerc.nasa.gov>
Source record: 24865

There's this fellow selling an EPROM programmer that hooks onto the
PC's parallel port. I was wondering if it works on our ST and TTs.
I looked at the specs and it appears that the thing requries 4 additional
lines on the PC's parallel port. What lines does the ST's parallel port
contain?

Clarence

M2L Electronics is happy to announce a new entry in the device programmer
market:

EZ-EP EPROM Programmer

1) Attaches to PC parallel port.
2) Only $149.95
3) Fast, programs 27C010 in 23 seconds.
4) Programs 2716-27080, plus EEPROMS and FEPROMS
5) Reads and writes binary, ascii hex, Intel Hex, and Motorla S formats.
6) Free software updates available via bbs.
7) Adapters for microcontrollers and programmable logic devices available.
8) Automatic detection of reverse insertion.
9) 30 day money back guarantee.
10) 7 different Vpp voltages (5.0,12.0,12.5,12.75,13.0,21,25)
11) 4 different Vcc voltages (5.0,6.0,6.25,6.5)
12) Automatic Device Identification Supported.
13) Mouse use supported

The EZ-EP is an inexpensive, compact, fast, and versatile EPROM/EEPROM/FEPROM
programmer. In its most basic configuration it supports devices from the
2716 up to the 27080 (2Kx8 to 1Mx8 both nmos and cmos). It also programs
EEPROMs and FEPROMS to 32 pins. It is attached to a PC's parallel port
(cable included) and requires no board inside your computer, thus it is very
easily detached for use at another location. The EZ-EP is also quite small
(3.25 x 5.5 x 1.25 inches) and light (approximately 8 oz). It is powered by
a 12VAC wall transformer (included).

Some other low cost device programmers on the market fail to properly
implement variable Vcc power supplies. The new, high-speed programming
algorithms all require Vcc to be variable (5V up to 6.5V) and some older
programmers do not support this. The EZ-EP properly implements the programming
algorithms specified by the device manufacturers; this ensures reliable
programming with guaranteed margins.

[Specifically, we have carefully reviewed our two nearest price competitors
and found that they do not implement the full range of required Vpp and Vcc

levels. The first unit has Vcc of 5.0 or 6.0 (but not 6.25 or 6.5) and Vpp of 5,12.5,21,25 but not 12.0, 12.75 or 13.0. The other unit is better on Vcc but just as bad on Vpp. For the first unit, this precludes use of the fast (100usec pulse) algorithms. The second unit, as best we can tell, goes ahead and uses the fast algorithms, even though it does not provide the correct voltages.]

The EZ-EP software uses a powerful, menu-driven approach and supports the use of mice. It supports both color and mono screens and works on notebooks. The software runs on PCs from older 8088 based machines up to the latest 486 that we could find to test it. Only 256K of ram is needed to run the software (no matter what size device is being programmed) and a harddrive is recommended but not required. Also, the software will run in "demo" mode without a programmer; you are more than welcome to download a copy from our bbs for a test drive.

Adapter boards for 16 bit eproms and some popular microcontrollers are also available. Their pricing is as follows:

8751 adapter - $39.95 (40 DIP)
8751 adapter (PLCC) - $59.95 (44 PLCC)
8742,48,49 adapter - $44.95 (40 DIP)
PIC adapter - $49.95 (18/28 DIP)
68HC11 E/A series adapter - $59.95 (52 PLCC)
16 bit EPROM adapter - $49.95 (40 DIP)
8755a adapter - $39.95 (40 DIP)
Serial EEPROM adapter - $34.95 (8 DIP)
Serial EEPROM adapter (SOIC) - $34.95 (8 SOIC)
PLCC EPROM adapters - $49.95 (32 PLCC)
SOIC EPROM adapters - $49.95 (28/32 SOIC)
ICT PEEL adapter - $59.95 (20/24 DIP)
(18v8,20g10,22v10)

All adapter units feature high quality zero insertion force sockets.

3397. SIMPLE VT100 TERM PROG ??

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-22 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <08221995.223409@empyr.dircon.co.uk>
Source record: 24866

Hi, I'm looking for a simple terminal program that will do proper VT100 emulation. I need it to log onto my university site from home.

I did have an english demo version of Connect that worked OK, ... until my hard drive died ! I downloaded it again, but this one was in German ! Anyway, Connect is far too big for what I want.

Any suggestions ?

Cheers,

Kev.

3400. Help with Mint/X-Windows/Chimera

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-23 00:00:00 UTC
From: bjr@EbiCom.net
Message-ID: <41e94m$5hr@Einstein.EbiCom.net>
Source record: 24869

Aloha,
I recently downloaded the TAF Mint package from Hensa, and have
it installed on my stock 1040STe 4meg system...but something doesn't seem
right. I'll just list my questions below...and hopefuly someone can help
me here.

1. I boot Mint, X-windows loads, and all is fine. I can get chimera, and
the Xterm (tcsh) to load with no problems at this stage, but, once
I establish a good ppp connection...chimera will not load into memory
at all...I get the message "No such application or pid". So...if
I leave my modem online...exit X-windows and do a warm boot...chimera
will finaly load...but...now when I try to download a html...the transfer
appears to take place with no problems and just before the document is
displayed, Chimera just dissapears and I'm looking at an empty desk top
yet again...so I run top to see if maybe it didn't just get hidden in
X-Windows somewhere...but chimera isn't anywhere to be seen. What's
the deal here? Why won't chimera load after ppp/chatfile has run to
establish connection? Why does chimera load fine after a system warm
boot and a pre-established ppp connection, yet remove itself from
memory after downloading an html/gif/etc?

2. Why can't I get my system to disconnect, that is hang up the modem
and kill what ever network apps were running? Once again, when I
try to use the "Disconnect" option in this particular X-Windows
set up I get, "Application or Pid Kill can not be open".

I suspect that something is messing with the path varible somehow, and
X windows simply can't find the applications being asked for...how would
I go about checking my set up to ensure everything points in the same
places?

3. Is there a way I can bypass X-Windows alltogether and use something
like lynux to browse the web? If so...where do I go to find binary
versions of this browser since I know nithing about compiling code?

4. Is it possible to ditch X-Windows? I tried making Mint bypass X-windows
and go straight into tcsh. It worked with one problem...no terminal
emulation at all...no vt52, no vt100, only dumb. What must I do to
give tcsh term capabilities?

5. Might there be a Mint compatible binary of Tiny Fugue, Tiny Muse, or
any similar client out there? It's nice to be able to establish
sessions that will pause the screen for you...and accept long unbroken
lines of text...not to mention capture everything for you in an easily
editable format.

6. Any suggestions for a mail manager?

7. News Reader? (tin prefered)

Thanks in advance for any attempts to get me on the right track here.
Brian

3401. Problem: Harddrive Backup For ATARI FALCON (post for friend)

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-23 00:00:00 UTC
From: jeremy@PROBLEM_WITH_INEWS_DOMAIN_FILE
Message-ID: <41fen7$6u4@dropit.pgh.net>
Source record: 24870

I'm posting this artcile for a friend. I usually don't go through these groups so
if anyone knows of a better place for this, please put it there.. Thanks and reply-to:
92051468@brookes.ac.uk...

Begin message:

I'm interested in buying a harddrive backup device, suchas a tape streamer,
for my FALCON's SCSI drive.

Can anyone recommend any hardware devices, or anyone who sells hardware,
pefereably in the UK?
Also can anyone recommend any software, or anyone who sells software, pref
in the UK? I'm told Diamond Back II is thebest software to use?

I have a 4 Mb FALCON (TOS 4.04), and a 540 Mb MiniS harddrive (SCSI).

Thanks for your time,
James (92051468@brookes.ac.uk)

Uniterm! Say no more say no more. It's small enough to fit on a single
floppy, and runs perfect VT100 emulation (I think it does VT220 also).
It's free. It's fast.

Hello,

do you have access to a UNIX-server with a newsgroup-reader like "Tin"?
This is how I get into the newsgroups of the MausNet and other nets
using a simple terminal programme.

So far I know, the Mausboxes exchange and update their data at fixed
times in the middle of the night (MET).
Until now I had no problems with it in reading the newsgroups via telnet.
You 've got to know the times when you connect to a Mausbox directly.

Bye,

Kerstin

3404. Did you C those stacks?

I have recently been working on porting a bunch of News software
to MiNT, on the whole very successfully except for the fact that
I have to do a "fixstk" on most of the stuff before it will run
correctly. I usually remember this after hours of debugging.
What am I doing wrong? Is there an env variable or something to tell
gcc to allocate something other than 0 to the stacksize? How to the
rest of you guys get round this problem and how does one know what
the correct size _is_ for any given application.

I think you guys missread the question. He is hooking his MFM drives
to an Adaptec SCSI to MFM board. He will then plug the Adaptec (which
is a SCSI unit) into the Link/Link II.

Yes, this will work for you. It is practically the same setup as most
people have (ICD ADSCSI+ with some MFM/RLL controller, where the Link
replaces the ADSCSI). What you will need is a cable that converts from
a 50 pin Centronics (on the Link/Link II) to a 50 pin system cable. I
had one custom made for less than $10. It involves two connectors and
ribbon cable.

3407. SCSI problems with Linux on a Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-23 00:00:00 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <41gab5$n1@nyheter.chalmers.se>
Source record: 24876

I recently fetched Linux-68k v0.9pl10 when I read in the announce
file that some problems with Falcon SCSI had been fixed. The earlier
version I had installed would lock up with some kind of time out error
after a random period of time.
Unfortunately the new version was much worse, it refused to even boot!
I tried two different 0.9pl9 versions as well with the same result.

When I boot the old version (probably 0.9pl7), the SCSI initialization
goes something like:
...
scsi: 1 hosts
Vendor...
Type...
Detected scsi disk sda at scsi0, id0, lun0

With the newer versions I get:
...
scsi: 1 hosts
scsi0: warning: target bitmask 00 lun 0 not in disconnect_queue
scsi0 reselection after won arbitration?

After that nothing more happens and the curson soon freezes.

Does anyone know what's happening? Or even better, how to fix it?
(For some reason I can't make the new versions boot even from ramdisk,
but that could hardly have anything to do with the SCSI problems.)

You can get a good deal on second-hand SCSI tape streamers. Look in Micro Mart - they ought to be around £80-£100. I have an Archive Viper 2150S and sleep better at nights!

JB> Also can anyone recommend any software, or anyone who sells software,

DB3 is fine. I use GEMAR (shareware) which also does the job. If you download GEMAR you will find it contains a list of devices and configurations with which it has been tested.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.programmer

Folks,
Im looking for a copy of a program called Xmon for the Atari.
It is a screen driver for a Moniterm 19" monitor (SM194). Apparently
it was written by Doug Wheeler (Ex "Code Head" programmer). Any one
know where I may be able to get a copy of this program?
Alternatively any one know what/where drivers are available for the
19" mono monitors. My friend (whom I'm requesting this for) is currently
running bigmon. He's had a few problems with this and was advised to get
xmon. Any differances??? Comments??

Thanks,

David

The maus BBSs do an update twice a day via modem/ISDN, so that any message is
in every other maus BBS the next day.

The gateway to Usenet is a totally different thing ... there are multiple of
those, and when they are run depends on local configuration of the BBS
running the gateway.

L>available real time. Is there an FTP site where the news
L>items can be downloaded from?

No. You will have to find a news server that carries these groups - most
bigger german newsfeeds should work.

CC>I looked at the specs and it appears that the thing requries 4 additional
CC>lines on the PC's parallel port. What lines does the ST's parallel port
CC>contain?

8 data (bidirectionsl), strobe and busy - the falcon has ACK and INIT, I
think.

You can get a Juniorprommer, Easyprommer or Vesuv for the Atari (the
Juniorprommer schematics and PCBs were published in the german ST computer
some years ago).

My shareware program 'Pinatubo' will work with these programmers when
attached to any Atari ST/TT/falcon (or Mac with MagicMac + McStout
interface). You can program Eproms up to 27080, 16-bit-EPROMs (like those
used in the falcon), 875x/895x microcontrollers and 28xx EPROMS - some of
these require simple adapters.

The only drawback is that there is only german documentation (an english
ressource is provided) - and you have to get or build the hardware.

That's perfectly understandable. But throwing away a program because it doesn't work with your relatively unique system is far different than telling others to throw away that same program that probably works fine on their system. That hardly seems fair nor helpful to the person asking for help.

If you suspect the PSU (and its a good a guess as any) then try a PC style PSU unit. It should just plug into the drive powe connector.

Other than that try and measure the DC volatges going into the drive. The RED wire should be 5V and the YELLOW should be 12V. The 2 BLACK wires are ground. A drop of over .5 of a volt might indicate a problem - however comapre these to measurements with the PSU entirely disconnected from the drive/controller.

All IMHO and AFAIK.

:-)

Wrong assumption. Once Mausnet ï¿½Ms have passed the gateway to Usenet, they
are in no way different from Usenet articles.

>Is there an FTP site where the news
>items can be downloaded from?

There are hundreds of NNTP servers where these are available, yet most of
them are located in Germany and Austria.

As your local news administrator to carry the groups.

A general monitor query really.

What are the degaussing coils for and what probs. will I have if I run a
monitor with them disconnected?

While I'm on the subject...the degauss coils are driven from the mains
through a 3-terminal potted device (known as RZ2 on my chassis).
What IS this thing? Some sort of impedance, I assume.

William, I have had like problems. When I boot in 2.06 on the ST I must have a floppy in drive A (blank will do). Beats the heck out of me what is going on. I have Compatibility Plus installed and X-Tra Ram card w/4 megs. Probably my soldering job :).

Roger Cain (rcain@nest.demon.co.uk) wrote:

: What are the degaussing coils for and what probs. will I have if I run a
: monitor with them disconnected?

The degauss coils are there to apply a high burst of alternating
magnetic field when your (colour) monitor/tv is first switched on. This
destroys any residual magnetic field that may build up which would
otherwise affect the convergence ot the three electron beams, giving you
fuzzy colour.

: While I'm on the subject...the degauss coils are driven from the mains
: through a 3-terminal potted device (known as RZ2 on my chassis).
: What IS this thing? Some sort of impedance, I assume.

The device of which you speak consists of of two resistors closely
bonded together, one with a high positive temperature coefficient.
The other resistor acts as a heater. At switch on the resistance of
the thermistor is low and a high AC current flows through the degauss
coils. As the heater heats up the thermistor, this current quickly
drops to near zero. It is this busrt of high current that make a
funny noise when you first switch on a colour display.

regards.

You can ignore the AV versions. They are for doing direct to disk
audio/video sampling.

Wide SCSI is a bit of a waste of time as the TT's SCSI interface is not
Wide.

I'm not too sure if you would get any benefit out of Fast SCSI drives for
the same reason.

Having said that - all such drives *should* work. They should all negotiate
back to boring SCSI-1 that the TT is talking. Some though will do it more
reliably than others ...

> Now, up until now I have just used regular SCSI drives. I know I can
> stick a regular SCSI drive on a SCSI-2 interface. Can I stick a
> SCSI-2 drive on my TT030, which is using the built in SCSI interface?

I have used a basic SCSI-2 drive (Seagate ST1280N) and SCSI-2 CD-ROM (Toshiba
XM5301) on my TT without problem. My boot drive however is a SCSI-1
Connor/Olivetti. The TT doesn't supply any TERMPWR so you will have to sort
this out as well. Should be just a case of enabling the built in active
termination on the new drive.

All IMHO and AFAIK.

:-)

I know you mean well, but there is no power cable to a 2,5 " drive, it is
incorporated in the datacable. Otherwise you're right.

>Check the data cable from HD to Falcon is secure.
>
>Check that any socketed chips are properly seated.

There aren't too many in a falcon, but yes, check that indeed !

>Use the floppy copy of your disc utilities to re-install the driver.

No.
If your data is important enough to you, *never* _write_ to a harddisk
that has malfunctions at the risk of losing everything.
First try to locate the problem. Try any of these:
-Check correct voltages from PSU.
-Check all cables.
-Try to boot from floppy with a harddisk-driver to ensure it's not a
software-/driver-problem, but do not install it on harddisk...
-(Again) Do NOT write to the harddisk !!
-Try other drive.
-Check drive in other falcon.
-Listen for different sounds coming from harddrive.
-Use falcon, after error occurs, with programs from floppy only.
If that works OK, at least 90 % chance drive is at fault.
-If falcon proves OK, try running a diagnostic program. Note that if
you try to fix a problem this way (with software), when the real cause
is a hardwareproblem, it will only get (very much) worse.
But if the drive isn't recognized, as you say, chances are very small
it is a softwareproblem.

I don't know how long your system works OK, but if data is important to
you try to make a backup on an external SCSI drive using Kobold.
(Kobold for speed, because you obviously haven't much time).
If need be in different sessions after cooling down.
Don't wait with this because if it _is_ your drive that is defective,
a moment will come when it won't do *anything* anymore.
I sure do hope it's not a seagate BTW :-(
If your data is _real_ important consider sending the drive to me.
(but first tell me the brand)

>If none of this works you probably have trouble in the HD itself. Have you

3423. SCSI HD options

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-25 00:00:00 UTC
From: troyc@bnr.ca
Message-ID: <41ja4a$5co@batph8.bnr.ca>
Source record: 24888

I am deciding on a new SCSI hard drive within the next few days for my
TT030.

I have come upon the following SCSI options for hard drives:

First, all drives now seem to be SCSI-2

(the following is stolen from an ad in computer shopper)

FAST - Fast SCSI-2 max xfer 10MB/sec
A/V - Fast SCSI-2 drives tuned for A/V performance (huh?)
WIDE - FAST WIDE SCSI-2 max xfer rate 20MB/sec
WIDE AV - guess.

Now, up until now I have just used regular SCSI drives. I know I can stick
a regular SCSI drive on a SCSI-2 interface. Can I stick a SCSI-2 drive on
my TT030, which is using the built in SCSI interface?

I am sorry if I show my ignorance here. I haven't had to buy drives since I
threw together my MFM/RLL configuration on my old ST.

Please help. I need a new HD soon and want to make a decision before long.

|> the message `Cant sync ....device p:', so the problem follows
|> the data.
|> Any ideas?

This may happen if your shell is compiled with -mbaserel to make the text segment shareable, and resides on the same partition. MiNT keeps an open descriptor on the program file to prevent other programs from changing it (open for writing will be refused). This also means that MiNT cannot lock the partition, because that would invalidate the file decriptor. You can get around this by starting fsck from the desktop for this partition, or to prepare a copy of the shell that has the sharing flag cleared (toglclr -fshare, i think), and use that when running fsck.

Yes, you can also put a SCSI-2 drive on a SCSI-1 controller, but you
won't get the advantages of SCSI-2, of course. I don't think you'll
get problems with WIDE SCSI either, but i'm not sure. In any way, you
will stay within the specs of SCSI-1.

From: Jeffrey Wood <woodzy@delphi.com>
Message-ID: <RrGC7P+.woodzy@delphi.com>
Source record: 24795

Hi, and welcome to Ch.A.O.S. Country. Welcome to the revolution. The Cheyenne Area Orphaned Systems, or Ch.A.O.S., is a club devoted solely for the preservation of classic non-IBM systems, such as ours, and for the defeat of Microsoft. If we wanted IB
M compatability, we would have abandoned our systems long ago. Those of us who do have IBMs, but still use our classics, only bought them out of necessity, such as for work or school.��This is not a political organization. We do not hold any specific r
ight wing or left wing political views. We do believe in fair competition and Microsoft is NOT fair. We spent all that time and money on our respective systems because the performed the task or tasks we bought them for. Wether it be for gaming, educat
ion, office, or whatever, our classic systems performed upto our expectations, and in some cases, beyond the original design. Why should we abandoned everything we put into our systems?��I have been working on the designs of two programs that I feel wou
ld unite all of our systems, yet retain the sovereignty or flavor of each individual system:��1. A terminal shell with game maker to allow two or more non-compatable systems to play games over the modem or in a mini-network. Of course, standard protoco
ls will have to be set between computers to ensure game play. But, graphics between two different systems wont have to be the same because screen data wont be sent, just tiny info packets. The games would take full advantage of the graphics and sound c
apabilities of each individual system. The games would be played as close to real time as possible.��2. A DEVICE OPERATING SYSTEM (DOS) desgined on a bi-level format: The primary level is a whole new computer that provides cross-platform compatability
between our classic systems. The computer will be based on the PowerPC. This will allow each classic system to be enhanced to that of at least a 486. Without losing much compatability with the existing sytems. Full compatability is not guaranteed be
cause of the new enhancements to each individual operating system. But, at least you wont have to abandon your whole classic system! The secondary level is a whole new disk operating system for the original classic. This will allow direct disk access
communication between ALL systems. Yes, even IBM. Just imagine, a C64 computer operating system with 38k free RAM, can now have as much as 3.75 Meg free RAM on a 4 Meg System! This is directly accessable without bankswitching or even use as a RAMDISK!
Just imagine the fresh, new applications that can be developed that retained the original C64s flavor. No, this is not limited to the C64, but to all classic systems, such as the Atari, Tandy CoCo, VIC20 (YES!), Apple, etc.��All of our classic systems
have their own uniqueness, their own distinctiveness. That is why we refused to follow the industry or marketing trends. This would allow us to preserve our systems and at the same time develop a cross-platform industry standard. Who says we have to
follow the Microsoft standard? Lets follow a standard, sure, but we should also be allowed to keep our systems we have devoted so much time and energy into!���Cheyenne Area Orphaned Systems�c/o Jeffrey Wood�813 Covered Wagon Drive�Cheyenne, Wyoming 820

: it means... Fred van Kempen, who wrote DIP, is an absolute arsehole.
: DIP always comes up with agressive messages when it doesn't understand
: you. Welcome to the UNIX world...

Yup, Welcome to the UNIX world alright. But don't blaim Fred, it's standard
UNIX you can't run anything without a proper UID (user ID). For normal MiNT
users that is root (uid 0). Problem is, DIP and most programs look up the
relevant information from the password file (/etc/passwd) and if the uid is
not in that file, you get that message. It needs to look up homedirs and
default shell etc.
I suspect the DIP install.sh is the problem by the way, it tries to be funny
and hardlinks every file in /etc/ to itself, thereby overwriting the old
file. It's very annoying.

Greets,
Thomas.

YES!

I`ve just installed the TAF/package on my Falcon, and it works! It took
a while to figure out the chatfile, but now everything`s working.

Almost...

Sometimes when I try to start Chimera I get the message "no such filename
(or pid)". And when it starts up it crashes all the time. X itself is quite
stable, but Chimera...

But who cares, I can just run Netscape and enjoy all those HTML 3-sites!
For those of you who don`t know it, here`s the procedure...

write xhosts + in your shell.
telnet to a site which has netscape.
start netscape by writing: netscape -display your-IP-adress:0

If you`re using a dynamic PPP-account you get a different IP-adress everytime
you log on, so be sure to note the adress.

After a couple of minutes Netscape appears on your Atari!

BTW, does anybody know if MiNT/X supports virtual memory? 4 meg is not much,
and Outside is a lot cheaper than 14 megs of RAM...

My version of BlowUP chrash when I run MiNT, are there any (newer) versions
that would work? I`d like som more space on my screen, especially when I`m
running Netscape.

The window manager allows you to set up a virtual screen which you can
scroll around. I think we sent it out with 2x2 but you can change this - look
in you $HOME/.fvwmrc file for 2x2.

Message-ID: <41r7rj$rlc@sol.caps.maine.edu>
Source record: 24802

Howdy!

Does anyone know of a concise & straight to the point guide to installing MintNet over MultiTos? I find the docs in the latest MintNet release a bit overwhelming and sparse... perhaps I missed something. I do not need to compile the package. I just want to install the binaries. Any help would be greatly appreciated.

Regards,
Bill

3434. HELP ---> HD floppy with a 1040STf

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-28 00:00:00 UTC
From: tom@ug.cs.dal.ca
Message-ID: <DE06uD.AL7@cs.dal.ca>
Source record: 24803

A have a high density (1.44) floppy set up as my B drive. There is power and the drive seems to be up and running... HOWEVER... the HD floppy drive doesn't want to read any disks. The little light comes on (indicating that the floppy is active) however it isn't able to read anything.

Can somebody tell me how I can make it read/write. Is there a software program that will help let my 1040f recognize the HD floppy???

Help!

Reply back here or better yet... reply to: tom@ug.cs.dal.ca

As I understand it, th HD mechanism is only part of the solution.
TOS<2.06 does not relate to HD disks. Also, there's something
called an Ajax chip which is necessary to read/write HD disks.

Set it to 1x1 to eliminate the virtual screen. 640x400 is a little
small though. Delayed image loading does not work right - I haven't
been able to figure out why - I am looking into it, though.

3439. HOW TO STOP QUANTUM TCUS

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-28 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <08281995.203622@empyr.dircon.co.uk>
Source record: 24808

Hi, I've just got a Quantum LPS105S, 105Mb SCSI-2 drive, and for the first 10 minutes or so, it is making regular TCUs (Thermal Compensation Updates, or 'chk chk chk' noises !). I *can* access the drive OK during this period, but if the drive is doing a TCU when the ST tries to access it, I get a 'data may be damaged' error. Once it has warmed up, it doesn't seem to do them anywhere near so often.

1) Is is essential that the drive performs these ?

2) If not, can I disable them and how ?

3) If they are essential / non-disableable (is that a word ?!), can I configure something in the ST to wait a little longer before giving me the error message ?

I am using an ICD AdSCSI+ host adaptor, ICDPRO drivers and TCACHE disk cache.

Do you think setting the # of retries to 4 would help ?

Cheers,

Kev.

Does this virtual screen use any extra ram. If it does how can you
eliminate it to free up that ram for Chimera?

I am trying to run it on a 4 meg Mega STE but keep running out of memory. I
have deleted all the 100dpi fonts and am just using the fixed font, that
freed up some memory. Does the delay image load option work? I have tried
that but can't seem to load an image when I click on the icon. Any other
ideas for freeing up some memory?

If it worked fine before, something is broken. I cannot say what offhand.
If you connected it for the first time and it doesn't work, no wonder.
The Atari 1040's need an additional piece of hardware to use HD drives.

Help. A friend just dropped off a Meagfile 30 that he bought, used and with no documentation. Also, when he bought it it had a 2nd RLL HD cabled outside. He removed the second HD, squared away the cables but now he can't talk to it and he didn't even try before. My questions:
1. Can someone explain the 3 position DIP switch, marked, left to right: 1 2 X ? I found then as 1 OFF (towards the front), 2 ON, (towards the rear), and X ON (towards the front).
2. The 20 pin control cable for the first Hard Drive: which of the 2 connectors should it be plugged onto? Right now it is plugged into the one towards the front.
Thanks, I checked all the old messages but my server doesn't keep them over 7 days.

3445. PAK030 Buffer Board?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-29 00:00:00 UTC
From: Landstrider <mgrove@owens.ridgecrest.ca.us>
Message-ID: <DE2Bzq.BtK@ridgecrest.ca.us>
Source record: 24814

Can some one that is using the Buffer Board available
for the PAK 030 Card give a brief discription of
the hardware involved. It has been recommended that I install
a 74F08 as a buffer for the clock at U65/Pin 8 (32mhz)
on the Falcon mother board, where the Mighty Sonic gets its
clock signal. This is to allow the Mighty Sonic and DSP to
function at 32Mhz. Does the buffer board allow adjustable clock
frequencys?

Thanks,

Mike

: 1. Can someone explain the 3 position DIP switch, marked, left to right:
: 1 2 X ? I found then as 1 OFF (towards the front), 2 ON, (towards the rear), and
: X ON (towards the front).
the dip switches labeled "1" and "2" (and even "4", but this one seems
always to be "hard-wirde" using a resistor) are used to select the device
adress (= ACSI target number) ("1" is the LSB). The switch "X" has something to do with
puffering
the signals for further devices on ACSI-out, just try out the right
position.
It may happen that only device 0 (zero) is recognized by the computer or
HD-Soft. So try device number 0 first (switches "1" + "2" off).

: 2. The 20 pin control cable for the first Hard Drive: which of the 2
: connectors should it be plugged onto? Right now it is plugged into the one towards
: the front.
This depends on what drive number (LUN = logical unit number)is selected
on your HD:
You should set your HD jumper for the drive number to 0 (zero) due to the
fact that nearly all HD-drivers lack the ability to use other drive numbers
(except CBHD I think).
The it is the connector with the lower part number (J9, I think). In the
moment I cannot recall the correct position.

Hope it helps

Martin

VME vga card for ATARI MEGA STE???
How am I gonna do that, I allready have a card but it is ISA, are there other ways to fit it into my computer? And what about the software? NVDI et4000 or some shareware? Or is it really necessary that I buy the VME card and NVDI et4000 from ACN in Holland? That would be than about $300... a little expensive, than I'll better wait for the mighty ATARI MICROBOX wich has the best specifications I have ever seen!!!
And my memory, can I put normal 30 pins simms into the sockets or do I need to by simms "specialy" made for that computer. For the moment I have simms 4x1MB but I want to change them with 2x4MB can I just do that?

3454. [Q] X11R5 Questions (KbdMap etc.)

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-30 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <422s43$rdu@status.gen.nz>
Source record: 24741

Hello,

I have recently obtained X11R5 for MiNT. I had it going in 10 minutes (so much for being hadr to install), but not knowing much about X, I have some questions:

Can that tiny font that is used everywhere be enlarged a little?

Can a more usable keyboard map be installed (I can't even find "/" on the German layout - real nuisance as you can see!)

How do I launch an X Programme? I for example launched XEyes from Sh (which was running in XTerm) and sure enough XEyes ran, but Sh appeared to have gone dead. Thus I was forced to exit and reload X. I would have thought there would be like a graphical sort of filemanager type thing to do this sort of thing.

Is there a MiNT X available that will work in 16 colours? What about one that just uses the VDI, eliminating these silly problesm all together?

Thanks for your help, as you can see I am new to X Windows, so some of these questions may sound somewhat silly. Sorry if these have all been answered before, but I have not been able to find any answers.

NOTE: A few things added, some sold, many prices dropped.
Enclosed is a list of the hardware and software that I am selling.
Please send me an e-mail if you are interested in something.
All prices are NEGOTIABLE.
You can contact me at:
BBS: (412)343-1422
Internet: asmodeus@telerama.lm.com
WWW: http://www.lm.com/~asmodeus/
there is a link on my home page for the current list of atari items

All above prices do NOT include shipping, and will be dealt with on
an idividual basis per order. All prices are in US Dollars, and payment
is to be in US Funds. Money Order payments will be shipped the day
after I receive payment, and personal checks payments will be shipped when
the check clears.

ATARI HARDWARE FOR SALE
All harware is Negotionable in price.
COMPUTERS:
1040 ST/F 4megs mem., tos2.06 TEC board,
ADspeed 16mhz upgrade. $300.00
1040 ST/F(M?) 1meg memory $175.00
1040 STE 4megs mem. $300.00

MONITORS:
Color Monitors atari brands $100.00
Color Monitors atari brands $100.00
(P) Color Monitors(broken, power box) $25.00
SM124 Mono Monitor $75.00

STORAGE DEVICES: (Hard drives and Floppy)
(P) Indus GT External 720k Floppy $70.00
Toadfile 130meg + 80meg HD w/ICD+ host $270.00
ShoeBox 80meg HD w/ICD+ host $110.00
20meg shoebox, atari adapter $90.00

OTHER HARD WARE:
WICO Bat-handle joystick (9-pin) $10.00
Epyx The Grip joystick (9-pin) $10.00
The BEst TrackBall $20.00
The Cordless Mouse (Practical Solutions)$30.00
Mouse Master $20.00
VIDEO:

(P)Monitor Master(toad brand?) $15.00
Video Key $30.00
ST Video Digitizer $15.00
The Complete Colour Solution (Sold ONLY as a set)
(Vidi-ST, Vidi-RGB and VidiChrome ST) $100.00
AUDIO:
Stereo Replay audio digitizer $90.00
ST Sound Digitizer (Hippopotamaus) $25.00
PARTS:
2 assorted Atari internal floppy drives for parts $8.00
1040 case and rf shield (used) $10.00
4 Atari 256k Simms from Ste (Make Offer) $35.00

3458. Low level hardware drivers?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-30 00:00:00 UTC
From: bjb@praxis.co.uk
Message-ID: <421k1m$2tt@skolem.praxis.co.uk>
Source record: 24824

Hi,

Can anyone out there help me find information on writing low-level (ie
no TOS/BIOS/GEMDOS etc calls) drivers for floppy drives, hard drives,
keyboard, screen serial ports... basically everything. I am
experimenting with writing simple operating systems so any of this
sort of info would be useful.

TIA
Ben

3459. Linux-67k CD rom

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-30 00:00:00 UTC
From: Simon Gornall <simon>
Message-ID: <DE4456.9tF@carmen.logica.co.uk>
Source record: 24825

AAAAarrrrrrrrggghhhh.

(I'm annoyed!)

The Linux-68k CD rom seems to insist on mounting all of your HD partitions when you try to install from it. The installation fails if you have a non-MSDOS (or so it claims, I thought there were differences between TOS & MSDOS) partition on the disk.

Think about it - the sort of person who'll install Linux is the sort of person with MiNT/minixFS on his/her disk... So, unless there's some info in the (German only) documentation that I've missed, I have to wipe all my Linux stuff from the disk, zero the partitions back to TOS and install Linux.

I can understand that it wants to mount the partition with the instdisk/ folder on, but WHY does it *need* to mount anything else???

Of course, HDdriver won't zero partitions, the MinixFS 'minit -r' option doesn't work on one of my minixFS drives, and when I installed AHDI (so I could use HDX) the damn thing refuses to boot from the disk it has just read AHDI from!!!

So I now have a dead Falcon - and I can't find my floppy for HDdriver... Fun, Fun, Fun. I *think* I have an old version of HDdriver on my Outside installation disk, but that still doesn't help me zero my partition - a fairly trivial job, one would have thought.

Angry.

Simon.

How about Gemini ? Looks good when I used it on Tos 1.02.
Or even KAOSdesk ? or TerraDesk.... there are lots of them, just look at aaue
or Hensa.

3461. Re: Problem: Harddrive Backup For ATARI FALCON (post for friend)

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-30 00:00:00 UTC
From: Alain DERENNES <derennes>
Message-ID: <421jrc$o07@melimelo.enst-bretagne.fr>
Source record: 24827

It depends of how many Mbytes you want to backup. The best way I have found isn't a streamer (too much expansive and very slow) but simply a removable hard drive like Syquest. I actually have a 88 Mbytes and I'm waiting for a 540 Mbytes in some months. For software, anything like Kobold is OK; itsn't a backup but a copy, and your "backup" is so fast than a hard drive because it's a hard drive.

Rich Mier (rbmier@winternet.com) wrote:

: Help. A friend just dropped off a Meagfile 30 that he bought, used and
: with no documentation. Also, when he bought it it had a 2nd RLL HD cabled
: outside. He removed the second HD, squared away the cables but now he can't
: talk to it and he didn't even try before. My questions:
: 1. Can someone explain the 3 position DIP switch, marked, left to right:
: 1 2 X ? I found then as 1 OFF (towards the front), 2 ON, (towards the rear), and
: X ON (towards the front).

This is the selector for the logical unit number. I can't remember the
DIP settings for LUN0, but if you use ICD's utilities to format it you
can get a report on which IDs are responding in which DIP positions.

: 2. The 20 pin control cable for the first Hard Drive: which of the 2
: connectors should it be plugged onto? Right now it is plugged into the one towards
: the front.

The one closer to the front is the one you should be using, so that one's
right. The one towards the back may not work; I've heard conflicting
reports that plugging a second mech into it may or may not work
successfully. (Though that may have as much to do with inadequate power
from the 50w power supply; put in a new PS and problem solved if that's
the case -- mine runs on a 130, powering a 250 meg mech, and it's just
fine, but the 50w was insufficient)

: Thanks, I checked all the old messages but my server doesn't keep them
: over 7 days.

: Rich Mier

>and a 50 MB HD. However, I have two questions:
>
>1) Can I use normal SIMMS for the Slots on the board (w, w/o parity,
> which size)?

Either, as parity doesn't matter nor harm. 1 MB SIMM's only.
both 100 ns, 80 ns and 70 ns should work, but try to get the same speed
as the ones you already have.

>2) Can I use any SCSI Harddisk as a replacement?

Sure. *Provided* that you can switch off the parity of the Harddisk, that is.
With parity it will not work at all. So be careful what you buy.
Also you must remove / disable the terminators.

From: lr-lang@csm.uwe.ac.uk
Message-ID: <1995Aug30.104119.9971@pat.uwe.ac.uk>
Source record: 24835

Hi there

Can anyone help me with a strange problem?

I'm using Timeworks DTP using a HP DeskJet 320 printer at 300 dots per inch.
I have an Atari-ST which has been upgraded to 2.5 mega bytes of ram and
a fairly large hard disc partition. I am using the supplied the GDOS
driver for the desk jet. The paper size I use is A4.

Whenever I try to print a page, the bottom inch or so is not printed!
I have tried fiddling with all the options I can think of, but I can't
get it to print. The printer is set up for A4 and will print good old
ASCII very close to the top and bottom of the page.

The same problem also happens when I use the the HP Laser Jet printer
driver either connected to the Desk Jet or an HP Laser Jet printer.

Any suggestions? (Other than buy a PC)

Thanks in advance.

Bob Lang

About the simms I almost now for sure that you can use normal
simms from a pc, when they are 30 pins.
I have the same question actually. But you can try it, that is
what I am going to do tomorow.

About the scsi Harddisk I think that you can, but it is best
(I think) to stay with QUANTUM, these are very good harddisks,
I have one in my mega ste4 (105MB) and in my pentium 75 (1.2GB)

Good luck!! Greetings, Jan Dooms.

Thomas Scheermesser (phy510@lab.appl-opt.physik.uni-essen.de) wrote:

TS>1) Can I use normal SIMMS for the Slots on the board (w, w/o parity,
TS> which size)?

You can use standars 30-pinn (NOT PS/2) simms, either with or without paruity
(ie. 1M*8 or 1M*9). 150ns is enough, faster is OK but does not give you more
speed.

TS>2) Can I use any SCSI Harddisk as a replacement?

Nearly ... you must be able to turn of parity at the drive, and apparently
there are a few drives that will not work with the MSTE adapter.

I am attempting to install 1.4 Roms in my ST (6 chip set.)

My TOS 1.0 (1.2?) Roms are printed on the surface with individual numerals
frorm 0150-0155. (Two High, Three wide):

0150 0151 0152
0153 0154 0155

Are how they are layed out on the board (Under the power supply)

My 1.04 's have the following labels: L0,L1,L2,H0,H1,H2. Where do these go
in respect to my TOS 1.0 chips. P.S. the sockets are labeled as follows:

U2 U3 U4
U5 U6 U7

with U2 being in the corner closest to the back and the Midi Ports. (Left
side when keyboard is on and ready to be typed at.)

Beyond that there are no other marks that make the chips unique in labeling.

Please mail replies to harmony@idir.net

Thanks.

```

It does use the Brainstorm JPEG decoder if installed and therefore makes use of the DSP (drawback being with only having 256 colours available you lose speed in the TC to 256 process). Registration allows as many JPEG's to be loaded as you want but it does seem very memory hungary and more than 4Mb's is advised for lots of large JPEG's to be used.

SOL does serve many purposes on the Falcon. It is a fast viewer which will display in 256 colours on the Falcon and has a wealth of colour manipulation tools, not seen in many packages. It is also well supported and with the likes of it's filters, scaling, warping and and scripted slideshows it is a very welcome addition to any Atari owners collection, Falcon or not. For the small registration price it certainly is one of the better picture viewers and manipulators.

>Has anyone got any comments about either the lighthouse tower case or the
>desktopper case for a falcon?

I have a Desktopper, it's a bit flimsy but there's lots of space inside, I have 3.5" IDE and PSU in it with easily enough space for a CDROM and possibly a 2nd drive. The front of the case has two plastic inserts whch need to be cut to make space for a drive which you need access to, such as a CD ROM - a bit cheap and tacky looking.

You will need Freekeys to go with it, this takes
your keyboard out from the Falcon (or ST) and puts it in a new case. The
cost from Sys Sol last time I looked was £100 for both.

There are some hidden extras, you can mount the power switch and reset
button at the front for another £15 and the SCSI kit is even more.

I don't know about the Lighthouse case, but I should give Sys Sol a list of your requirments and ask for a quote for both cases.

The other option is to get a PC tower case and adapt it.

Phil.

3477. Slip/ppp source code for Atari

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-31 00:00:00 UTC
From: Alex@alshouse.demon.co.uk
Message-ID: <809894278_OASIS_@alshouse.demon.co.uk>
Source record: 24746

I'm wondering if anyone knows of some source code that provides a basic slip/ppp conection with a dialer. I'm thinking of writting some code arround this to provide a graphical interface. I don't think its possible to talk though NOS as i'm only single tasking :)

Thanks in advance for any info.

Has anyone got any comments about either the lighthouse tower case or the
desktopper case for a falcon?
I am looking for a new case, and these are the two choices I have found
so far.
Do these come with a power supply and/or keyboard?
Are they worth the money?

Thanks for any help,
Phil

Bob,

It would seem that your driver is only set to print in US Letter format.

My recommendation is to find a UK version of the same driver.

Another possibility is to use the now PD "FontGDOS". It had a few
printer drivers, and if I remember correctly, it had an HP driver. Best
of all, they (the drivers) are configurable.

Good luck!

Rich

Am looking for a text file or something of the sort that explains the popular sample file formats. AVR, AU, SPL, IFF, WAV, VOC, etc. (I have the DVSM docs).

I would appreciate any help you can give. I have looked on a couple FTP sights, but I haven't found such a file. However, if it may be contained within some kind of sample editing program, then I would appreciate the name.

Thanks,

Rich

: Well, I'm getting tired of my TOS 1.0 desktop, so I decided to grab Thing off
: Hensa. Alas, it needs >=1.4, what other (PD/Shareware) choices do I have?

The only reliable one I used under TOS1.0 was Terradesk - it's quite nice
but it doesnt compare with Thing. EASE works with TOS1.0, but it's
commercial. I don't know what hardware and software you have, but I would
seriously consider buying MagiC; gets rid of all those annoying TOS bugs and
seems to double the speed (at least in some cases) of every system function.
You could run Thing fine then!

Cheers,

Richard

3484. TT floppy disk problems...

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-31 00:00:00 UTC
From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <DE5z66.1yG@cf.ac.uk>
Source record: 24753

Hi reader,
Wondering if anyone has experienced a similar problem as this with writing to floppy disk on the TT. Quite often when saving files to disk, they appear to copy from HDisk to floppy without problems, verify on and directory structure appears fine. However when I try to reload the files, they are corrupted. Picture files appear to be "displaced" at certain points, giving a broken up look. Programs report "not executable file" and midi files don't work at all. However text files seem to be ok! No problems when reading disks, but saved pictures show similar problems on other machines, hence a writing problem. Perhaps it's a heat problem (the disk drive is above my graphics card which gets rather warm), or maybe the disk controller is playing up. I'm going to try an external drive and see if I can identify the culprit!

3485. Re: [Q] X11R5 Questions (KbdMap etc.)

>much for being hadr to install), but not knowing much about X, I have
>some questions:

>Can that tiny font that is used everywhere be enlarged a little?
Yes, you'll need some fonts (I can't remember if there are any in the
default distribution), and then you can change things in the
/usr/lib/X11/app-defaults/XTerm etc. files or other places. Two things
you should definitely get (if you haven't yet) are xvt (a much smaller
[code size] XTerm) and fvwm - a much smaller and much better (IMO)
window manager.

>Can a more usable keyboard map be installed (I can't even find "/" on the
>German layout - real nuisance as you can see!)
Yes. What keyboard do you have? There is a UK keyboard map in
clients2.??? I think, or maybe ukxkbd.??? If the worst comes to the
worst there is a program called xmodmap which allows you to map the
keyboard scan codes to characters.

>How do I launch an X Programme? I for example launched XEyes from Sh
>(which was running in XTerm) and sure enough XEyes ran, but Sh appeared
>to have gone dead. Thus I was forced to exit and reload X. I would have
>thought there would be like a graphical sort of filemanager type thing
>to do this sort of thing.
Just put a '&' on the end of the command line to indicate that the
program runs in the background. There are X based filemanagers under
Linux, but I don't know if they've been ported yet.
How much memory do you have? X programs are very big when there is no
DLL system (come on you MiNT guys... :-) so you may only be able to
run a few.

>Is there a MiNT X available that will work in 16 colours? What about one
>that just uses the VDI, eliminating these silly problesm all together?
Nope... neither.

> not give you more speed.

150ns is as fast as necessary using 256k SIMMs (ie to get up to 1Mb) but
when using 1Mb SIMMs it's 120ns (source Paul Rossiter). Not that this is
very important because you'll be lucky to find anything slower than 80ns
nowadays.

> TS>2) Can I use any SCSI Harddisk as a replacement?
> Nearly ... you must be able to turn of parity at the drive, and
> apparently there are a few drives that will not work with the MSTE
> adapter.

Even those drives that don't have jumper pins to set parity can be modified
using software, such as is available with ICD Pro utilities.

I recently got one of these babies for my MegaSTe, rather nice! However,
I haven't managed to get the 'drive busy' light working - I don't know
where to plug it! System Solutions told me there is a white plug at the
back of the drive, but when I looked there was no such thing. What I have
found is a _very_ small white plug shown with an 'X' in this diagram.

```
UNDERSIDE OF DRIVE:
+----+--------+
| | | -> power and data cables
| | | ->
| | X | ->
| | |
+----+--------+
^
|
PCB
```

Is this where you plug the light? If it is, I can't, because the plug on the
lead to the light (fixed to the HD housing) as supplied by Atari is too big!
That shouldn't be a problem though, I just want to know *where* to plug it!!

Also, does anyone know what size the cache on this drive is? Karl at SS told
me either 256kb or 0.5Mb, but I'm only curious... if it's the latter then I'll
be impressed - to think, the equivalent of my 520STFM simply for a *cache*!
Maybe I could throw in a 68000 and some other bits, to make another ST.

Now what about the different models? Mine's a Maverick (oh yeah, if anyone knows
the access time for these I'd be glad to know too) but when I asked for a box
to take it home in I got one with 'Lightning' written on it. Which is newer
or what are the differences?

Cheers for any info

S.Lai

P.S. Currently saving hard for Diamond Edge 2, a few weeks ago I 'lost' about
100Mb of free space on my drive C: Methinks it was caused by a system crash. I
had one when playing a module in ProTracker, it must have been corrupted or
something. Is this a good package? (DE2, that is...)
P.P.S. Is there any software that will format a single partition? I have AHDI
(on the MegaSTe 'Advanced Hard Disk Utilities' disk) but the format option, once
selected, seems to kick the drive straight into action. I don't risk it - I hit
the reset button in case there isn't a dialogue box following with a choice of
'Do you want to format the whole drive or just a partition' sort of thing. I also
have HD Driver (very cool) but this doesn't format.

3488. Falcon For Sale!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-08-31 00:00:00 UTC
From: "Info. Sys. Professionals" <isp@teleport.com>
Message-ID: <425eem$nkd@maureen.teleport.com>
Source record: 24757

SYSTEM FOR SALE:

Hardware:
Atari Falcon030 w/ Internal HD Floppy Drive (like new!)
4MB RAM
85MB Hard Drive, partitioned for Falcon Speed
Motorola 68882 FPU
Falcon Speed 6.2 DOS Emulation Daughtercard w/ software
Supra 2400 Modem w/ cable
SCSI-2 Cable to attach an external drive (drive not included)
VGA & RGB Video Cable Adapters -- use a PC monitor!
Latest CPU Modification
Mouse
CPU & mouse covers
Surge Protector

LOTS of software -- almost 100 floppiesï¿½ worth -- such as:
Truepaint (painting/drawing)
Ishar (game)
AtariWorks (word processor / database / spreadsheet)
Chaos Strikes Back (game)
Castles (game)
The Immortal (game)
Hostage Rescue Mission (game)
Dragon Lord (game)
STalker 3.04 (telecommunications / modem software)
STeno 2.11 (text editor)
DOS / Windows 3.1 installed on hard drive, w/ utilities, etc.
LOTS of shareware/freeware/demos
and more....

Comes with all necessary cables, original system disks & manuals. Asking
$1150, but make me an offer!

I'm writing this small announcement that from tommorow 1st September my current email address msh@dl.ac.uk will no longer be vaild and that you should use my new and permanent email address dlms@nessie.mcc.ac.uk. Please also note that I'm going to be off the net for a few weeks until roughly the 25th of September so please be patient if you write to my new address and don't get an answer. I will deal with all mail when I return and and will clear the 40+ backlog I have at the time of writing this.

Whilst I'm away the Atari Web pages will obviously have a bit of a holiday, but believe me it will be under a major set of revisions, improvements and additions when I return as I have tons of updates just waiting to be included and I'm designed graphics to improve it's appearance.

See you all in just over three weeks. Take care!

> Can that tiny font that is used everywhere be enlarged a little?

Yes - its the 'fixed' font which AFAICR is defined as 5x7. You need to edit the file 'fonts.dir' and change this to another font you have.

> Can a more usable keyboard map be installed (I can't even find "/"
> on the German layout - real nuisance as you can see!)

Yes - but I don't have the details handy.

> appeared to have gone dead. Thus I was forced to exit and reload X.

What you need to do it tell the X program to run in the background. This cuases the shell to return to the prompt - and the X program to run. Try:

Xeyes &

> I would have thought there would be like a graphical sort of
> filemanager type thing to do this sort of thing.

There are several file manager type programs around. However the whole philosphy of X is not to build anything in - and just provide the bare bones. Unfortunatly the X11R5 for MiNT isn't even a full working distribution of the standard X11R5 system - letalone an enhanced version as supplied by workstation manufacturers. However having said that - MiNT-X is a real X11R5 implementation - and is about as good as you could expect for a MiNT based version. Extra tools and utilities are available for it also.

> Is there a MiNT X available that will work in 16 colours? What about
> one that just uses the VDI, eliminating these silly problesm all
> together?

No 16 colour version AFAIK. Using the VDI is not practical either as it would require much rewriting of the X Server. It would probably be easier to write a 16 colour driver for the current MiNT-X than get the VDI involved.

:-)

My TT's floppy disk drive has started playing up recently. I had a lot of problems with heat and the TT-Hi mode chip getting too hot. Anyway I've fixed that - but part of the fix was taking the Video sheilding out. I'm tempted to put it back in to see if it solves the problem with the floppy.

Having said that - I get different sorts of errors. Mainly:

Drive not ready.
data on drive A may be damaged.

Retrying almost always solves the problem.

Roland.

Source record: 24761

Richard John Kelsch (richcsst@crash.cts.com) wrote:

: I don't blame your impatience though. System Solutions are dragging
: their heals.

Rich, I dont think it's quite that simple. System Solutions have stated all along that MagiC 3 wont be released until it works properly with the Falcon. There is an awful lot of extra programming that has to go into the Falcon version for the DSP support, extra screen modes etc; the Behne brothers have stated that the Falcon version was much harder to code than MagiCMAC! As far as I know it wont be too much longer before the English release of MagiC 3 appears, but considering how quickly MagiC has been developed in comparison with Microsoft's horrendous attempt on the PC, neither System Solutions or the Behne's should be criticised for dragging their heels.

Cheers,

Richard.

CL> out?

Hard to tell from this but it doesn't sound badly wrong. As long as he is aware of precautions to take with tube voltages:

0.SWITCH OFF and leave for an hour.
1.Take off the back.
2.Dust around everything with a 1/2" paintbrush and the nozzle of a vacuum cleaner.
3.Check and clean-up all plugs going into the PCB.
4.Look for any loose wires going into the tube deflection coils.
5.Look for any capacitors which have bled onto the PCB and replace.
6.Switch on and carefully adjust all likely pe-set pots EXCEPT the one labelled B ADJ.

The quoted access times and transfer rates are not very useful as much depends on the host m/c and driver. Use the PD progs HOW_FAST or HDCHK13 to measure them on your m/c.

l> P.P.S. Is there any software that will format a single partition? I
l> have AHDI

No but many utils will "zero" the FATs for a partition which is probably all that's wrong on your drive.

They are dead, gone, and buried The "company" was sold some years ago and the new mgmt basically just dumped the inventory as fast as they could. Gordon Monnier (sp?) doesn't have anything to do with the Atari anymore, AFAIK, and he was the life-blood of Michtron to begin with.

I have a few of their programs around I'd be willing to sell, cheaply, if there's something in particular you're looking for.

YES! I stumbled upon FontGDos in a german PD library a couple of days
ago. You're right about the drivers. However they have expanded the
printable area by about an extra 1cm (which is still useful), but I still
have a margin of about 2cm at the top and bottom. This is acceptable
but I'd still like to do better!

On the bonus side, the Desk Jet driver in Font GDos appears to print faster
than the timeworks driver.

Regards to all

Hi,

Well, I decided I am going to setup a BBS with my MegaSTE with
version 2.05 of TOS, that has UUCP internet ability. Only thing is I
have the Atari HDX V5.0 program, which doesn't seem to recognize the
Seagate drive I put onto it.
(It came out of my Macintosh Q840AV).

My MegaSTE is a very capable machine and I still enjoy programming
it. So I want it to do something. :)

Does anyone know how to format, partition and install this 500MB
monster on my MegaSTE. I try the AHDI.PRG program, but it won't
acknowledge that a drive is there.

Ug, I downloaded Terradesk off of Hensa, turns out with all the other crap I
have loaded in, I only get about 350k free RAM on my 1mb system. Grrr!!!

Anyway: The main reason I want a replacement desktop is so I can move* files.
Copying and deleteing takes too* long. And renameing folders would be nice.
Any ideas?

I also had the same problem with the TT floppy disk drive. I purchased
a replacement drive but the problems persisted. Eventually I found that
the problem was the position of the monitor, by moving the monitor
which sits on top of the TT case the problems went away.

Hello,

Have you already tried the program HD PLUS 6.0f from
the German company Eickmann? It is a great program to
handle scsi, and other. You can make partitions almost
as big as you want. I have it also for my mega ste with
only a 105 mb scsi but it works really good.
I hope you can do something with this information.

greetings, Jan Dooms.(jandooms@tornado.be)

Ben Bell (bjb@praxis.co.uk) wrote:
: >Can that tiny font that is used everywhere be enlarged a little?
: Yes, you'll need some fonts (I can't remember if there are any in the
: default distribution), and then you can change things in the
: /usr/lib/X11/app-defaults/XTerm etc. files or other places. Two things
: you should definitely get (if you haven't yet) are xvt (a much smaller
: [code size] XTerm) and fvwm - a much smaller and much better (IMO)
: window manager.

Ok. I found some fonts. But things like Chimera are all setup for thses
Helvetica fonts. I can't find these Helvetica fonts. Are they available,
or do I just need to change the configuration files to use the ones I
have got?

: >Can a more usable keyboard map be installed (I can't even find "/" on the
: >German layout - real nuisance as you can see!)
: Yes. What keyboard do you have? There is a UK keyboard map in

It's ok, I found a thing called ukXkbd, and that fixed the problem.

: Just put a '&' on the end of the command line to indicate that the

Yes, that works now.

: How much memory do you have? X programs are very big when there is no

4MB ST RAM and 4 MB TT RAM. Doesanyone know ehether X works with outside
virtual ram?

: DLL system (come on you MiNT guys... :-) so you may only be able to

What's a DLL system? I ran about 8 applications at once, then it said
that it had run out of <something>. I forget what it was now. I know that
I could only run 2 XTerms then it was "Out of PTYs" but Ithink this was
something else. It wasn't out of memory though, somehting else.

What is a PTY?

: >Is there a MiNT X available that will work in 16 colours? What about one
: >that just uses the VDI, eliminating these silly problesm all together?
: Nope... neither.

What a pain. Well, is it possible? If it is, somebody must have done it
somewhere. I can't see why it would not be possible. I think it would be
great to have X11 running in a window under GEM (this should be possible
too, all the parts of X11 that draw to the screen would just need to have
some additional handling put on them.)

Where can I find applications compiled for MiNT X? I got it from
ftp.cnam.fr, and there area fw on there.

Thanks for your help!

Steinberg only sold those, they were manufactured by SoundPool. If they don't sell FDIs anymore - bad luck for them, you can get a better interface (IDA) from Catch Computer here in Aachen - the IDA interface has 4 digital inputs and outputs, and can also handle 32kHz sample rate (DAT longplay). It has a FDI compatible mode.

T r a n q u i l

Welocme to Mnilu . .... Now at least Mnilu Tranquil ,GFA BASIC
'Compiler' is here for all you GFA BASIC coders. It's not the
official GFA compiler ,and nor can it replace the official compiler,
but it will enable everyone without a Compiler to turn their .BAS or .GFA
files into stand-alone .PRG files.

Mnilu Tranquil can be considerd the 'second' version of Mnilu.
It is by no mean the 'old' Mnilu with added support for GFA BASIC 3.5E,
but the GFA v2 compiler part has also had a _huge_ face lift.

Fully compitable with most GFA BASIC (v2 or v3.5e) files.

Mnilu Tranquil will soon be avaliable from the major Atari ftp-sites.
Or email to get back a UUEcoded version.

Please note that Mnilu Tranquil is postcardware.

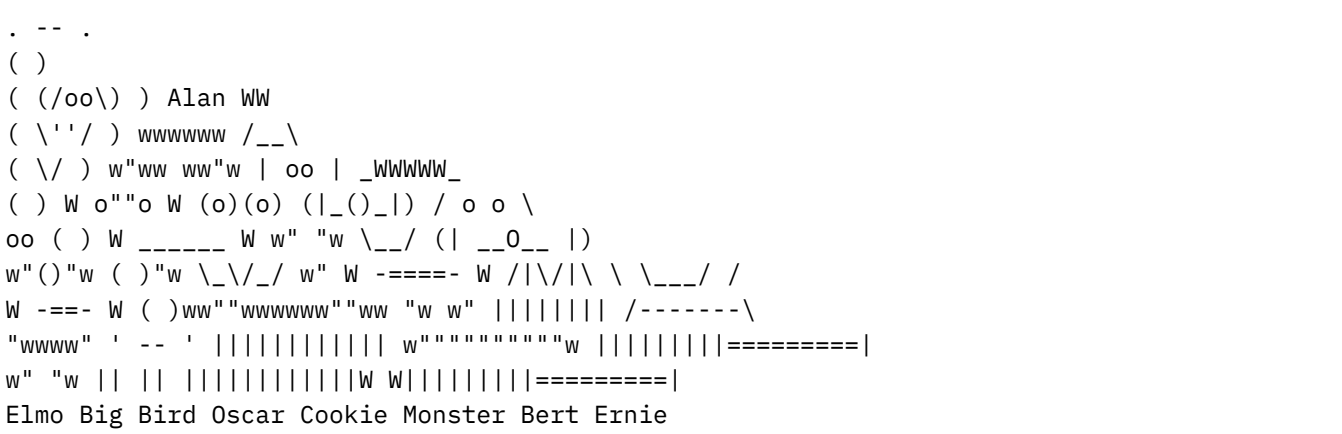
3515. Memory upgrade of ST

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-01 00:00:00 UTC
From: Alan Mathers <alan@browns.co.uk>
Message-ID: <809972129snz@browns.co.uk>
Source record: 24784

Can anyone help me????

I have been trying to upgrade a 520STFM for a friend, but have had some problems doing so.

I believe the mother board is a fairly old example and has 2 banks of 16 memory chips - one filled (47128 chips I think) and the other vacant. I have soldered DIL headers onto the board for the chips and the ST works fine with them in.



After obtaining some very similiar chips from an old XT board (417128?) and carefully inserting them into the sockets, the ST refuses to start. There is always a family of 2 to 20 bombs on the screen and usually colour washes too! (Very good for a graphics demo I'm sure!)

Does anyone know about any links to be made / broken, or perhaps the XT chips are too slow?? The ST still works fine with 512K.

There are three (256/1024) links on the board, all of which are set to 1024, but I think they are for the ROMs.

I will be very glad if someone could help,

Cheers Alan...

3516. BLITTER UPGRADE NOT WORK

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-02 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <09021995.144009@empyr.dircon.co.uk>
Source record: 24641

Hi, I have recently been given a Blitter Chip, and I can't get it to work.

I have an 520 STFM (Rev 'D' board), with the following upgrades already installed:

Marpet XTRA-RAM Deluxe board with 4Mb on it.

TOS has been changed from 1.02 to 1.04 (Possibly 1.41 if such a version exists, as four of the TOS chips have 1.41 on them, the other two have 1.40)

Everything has been working fine up until I tried to install the Blitter.

I got the correct socket (at a price !) and soldered it to the board, the correct way around, NO dry joints / breaks / joins etc. I removed the solder from pads W3 and W4 (Blitter enable points) and installed the Blitter the correct way around (small dot pointing to the left, where pin 1 is marked on the PCB).

When I switch on, all I get is a black screen (hi res mono) and the power light on the ST. Nothing else. The floppy light does not come on and it won't boot at all.

If I remove the Blitter and reconnect the W3 and W4 solder pads, my ST works fine again.

Is there some strange incompatibility with Blitter Chips and TOS 1.04 ??

...or do I have a dead Blitter chip ?

The Blitter part number is: C101643-011, ATARI 1987, B004 38809.

Is there any way I can test it ? I have a variety of test gear, including a 20MHz oscilloscope, a good Digital meter with a zillion functions on it, but no logic probe.

PLEASE !!! Can ANYONE offer me any help on this ? It has taken me almost a month to track down the correct socket and now it all seems in vain.

MANY thanks in advance,

Kev.

3517. [Q] FreeMiNT makes some apps not load. How to fix?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-02 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <42ae52$pt9@status.gen.nz>
Source record: 24642

I have obtained FreeMiNT 1.12.4, after beimg advised that it would let
SMail run properly.

However, it causes other problems also, which make it just about unusable:

Certain programmes simply will not load. After double clicking on them,
the hard drive accesses for half a second or so, and that's it. The
programme runs for an instant, then exits. One of the affected programmes
complained about being unable to allocte memory, so I suspect this has
something to do with the problem.
Affected programmes include:
Most programmes compiled in HiSoft BASIC
DuFTP
GEMMail
ESS-Code 6.3 (This is affected in a different way - hangs on quitting.)
And probably a number of others that I will find as I try them.

So, does anybody know how to rectify these problems? Somebody must be
using one of these programmes under FreeMiNT, or else they must be using
smail under normal MiNT - which would also be satisfactory - though I
really want to get FreeMiNT working, as I'm told it fixes a number of
bugs in normal MiNT.

Thanks very much for any help!

WHen using the MSTE internal host adapter, you need to
- turn off parity on the disk drive
- set the drive to ID 0
- switch off termination on the drive (jumper or remove termination
resistors)

HDX should then work with the drive - otherwise, you could try the ICD Pro,
or SCSItool software.

Moving files and renaming folders even is most easily done witha program
called Maxifile by Charles Johnson. It is either mouse or keyboard
controlled, works as an acc or program and also works well with his
alternate file selector, Little Green Selector. It also formats disks
etc. The ultimate file management utility for TOS under 2.06 and other
desk replacements

I can run HDX.PRG even when I've booted with HDDriver. HDDriver is
compatible with AHDI in every respect AFAICT. After all you must have used
HDX.PRG to format your disk.

Bye folks....

I picked up an old 520 ST in a thrift store and it didn't come with a floppy or a monitor, but I have tons of spare amiga parts. I'm figuring that the floppy is similar (as in like a pc floppy) and the monitor must be a 15 khz RGB kinda deal (for the 320x200 and 640x200 modes). So if anyone can get me the pinouts of the monitor and the floppy port I can probably build adapters for them. Let me know if you can help. Thanks!

Greetings!

I currently use my Atari Mega ST4 for music composing, running Logic 2.01. I've also several friends with STs that I supplied who need some things, and another friend who's interested in one. We all use the systems for musical applications, running everything from Logic (me) to Omega II to Realtime to Twelve.

We're looking for the following:

1. Cheap 1040s! Most of my friends have 520s, and while they're happy with them, they realize that more RAM is a Good Thing.

2. Cheap SM124s! Unfortunately, one of the SM124s I gave a friend died on him, and he needs a replacement. Another friend of mine has an ST he's dying to use, but he needs an SM124 for it.

3. Cheap SF314s! The 520s I supplied (got them for free from work, they were going to throw them away) all have SF354s, and one friend (the friend who also needs a monitor) has no power supply for his SF354.

: Richard John Kelsch (richcsst@crash.cts.com) wrote:

: : I don't blame your impatience though. System Solutions are dragging
: : their heals.

: Rich, I dont think it's quite that simple. System Solutions have stated all
: along that MagiC 3 wont be released until it works properly with the Falcon.
: There is an awful lot of extra programming that has to go into the Falcon
: version for the DSP support, extra screen modes etc; the Behne brothers have
: stated that the Falcon version was much harder to code than MagiCMAC! As far
: as I know it wont be too much longer before the English release of MagiC 3
: appears, but considering how quickly MagiC has been developed in comparison
: with Microsoft's horrendous attempt on the PC, neither System Solutions or
: the Behne's should be criticised for dragging their heels.

While I completely agree with you on your analysis of the MagiC for
Falcon explanation, I do not agree with my analysis of them "dragging
their heals". Why? Promising a product at a certain time takes
responsibility and a risk. If you are going to promise something, then
you damn well better deliver at the time promised. The MagiC for Falcon
was promised for delivery in late 1994, yet delivery is still "soon".
People wanted to know why Atari kept making similar stupid promises.

It is better to overestimate a delivery date and deliver earlier rather
than underestimate and get customers pissed at you. Sure, the product
will be delivered at exactly the same time in both scenerios, but the
customers have respect for you in only the first. If MagiC for Falcon is
so difficult to code (which I believe is true), then why didn't they just
be honest with customers in the first place and say it was going to take
a while? Instead of promising dates and constantly bumping them up.

That is my definition of a company dragging their heals.

Rich

: I always understood that Outside worked with MiNT. At least the demo
: does, and a club member here uses it with MiNT regularly. But I don't
: know whether it works with X11 or not.

Outside simulates Extended memory on TOS and MiNT (TT RAM). It
traps the Malloc(), Mxalloc(), Mshrink(), and Mfree() calls. However, it is
not compatible with X11 as it uses a different memory allocation sceme.
I similar driver could be written for X11, but I do not know of one.

don't talk crap, Outside doesn't catch the calls to the memory
allocation/de-allocation routines, it actually traps the system when it
accesses non existant memory [the virtual memory] and if this is within
the virtual limit set, will swap that memory page into real memory and then
try the instruction again. Of course swapping some virtual memory in also
means swapping some memory out, and thus this gets written back to disk.

Bye folks....

3539. QUANTUM HD WARMUP ????

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-03 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <09031995.121730@empyr.dircon.co.uk>
Source record: 24658

Hi, I have got a Quantum LPS105S 105Mb SCSI-2 drive connected to my AdSCSI+ host adaptor. When I first switch my system on, I get 'MSense $FE 0,0' errors quite often. It will sometimes just bypass several auto folder programs and just launch Ease Desktop which is the application selected to autorun in XBOOT.

For the first 10 minutes or so If I try to run any applications, I frequently get 'Data may be damaged on Drive (n)' errors and 'MSense $FE' errors.

After it has 'warmed up' the problems disappear.

The Quantum also makes periodic TCU's (Thermal Compensation Updates, or 'chk chk chk' noises) which I have gathered are quite normal, but these also disappear once the unit has been on for about 20 minutes.

I have recently added a Seagate ST125N 20Mb SCSI drive to the chain, as ID 1, and so far, this has not given any similar problems, although I do not boot from this drive.

Has anyone ever heard of hard drives needing to 'warm up' before they will function correctly before ?

I do not have the docs for the ICDPro drivers I am using, just the handbook for the AdSCSI+ and there is no mention of a 'MSense' error. I have seen 'Sense' errors before on my old and now totally dead Rodime, but never 'Msense'.

Anyone got any ideas ?

Many thanks in advance.

Kev.

: I REITERATE: WHAT AM I DOING WRONG????

Have you got an /etc/resolv.conf? It looks something like:

domain domain.name
nameserver xx.xx.xx.xx

You can have more than one nameserver (and it's a good idea), but you can
only belong to one domain. You must put IP addresses in the nameserver,
because to resolve hostnames, you need a nameserver to resolve from!

: SO WHY DOESN'T ANYONE HAVE THE GUTS TO RESPOND TO MY QUESTIONS?

Lighten up, bobo. With an attitude like that, you won't get any answers.

I cannot get Chimera or DUFTP to work!!
First of all, every time I try to move Chimera around on the screen,
it jumps over to the right edge of the display, leaving me looking at
a few pixels of scroll bar. Also, any time I try to link to any document,
Chimera gives me a "cannot open html::<document name>" message.

WHAT AM I DOING WRONG????

I have a good PPP connection to the net, and I can use FTP.TTP to connect
to a site IF I GIVE THE IP ADDRESS, but if I give the name of the site,
no dice.

Also, DUFTP does not want to connect to any site I give it. It cannot locate
the site.

I suspect that my DNS is set up incorrectly, but have no idea how to set it
up. I have it pointed to the name server on my Internet host, but it does
not seem to want to look up the names.

I REITERATE: WHAT AM I DOING WRONG????

I have repeatedly posted these questions to all the pertainant
COMP.SYS.ATARI groups, with no help. COME ON PEOPLE, LET'S STICK TOGETHER!
I have answered other peoples questions to the best of my ability. I
know there are some people out there who are using Chimera successfully.
SO WHY DOESN'T ANYONE HAVE THE GUTS TO RESPOND TO MY QUESTIONS?
Any advice would be appreciated!

I'd really like to get on the Web, and I'd really like to to it on a
machine that does not have to have a personal blessing from Bill Gates
to boot, but with this level of non-support, even a long-time Atarian
like myself gets a little frustrated. And every one of us that leaves
hurts the community.

COME ON, SOMEBODY ANSWER ME!

3545. Using Lattice C 5 to cross compile to 68K SBC

I think you may be able to alias the fonts somehow so that calls for
Helvetica map to a font you do have, but I don't know how to do it off
hand.

>: DLL system (come on you MiNT guys... :-) so you may only be able to

>What's a DLL system? I ran about 8 applications at once, then it said
Dynamic Load/Link Library or something like that. It means that the
the the libraries (the bits of programs which handle the talking to
the operating systems, carrying out common procedures etc) are only
loaded once and all programs share them, so even for 100 X programs
you only need the X libraries (which are big) loaded once. Otherwise
programs each have linked in the same libraries and you get disk space
and RAM being used up for the same code over and over again.

>that it had run out of <something>. I forget what it was now. I know that
>I could only run 2 XTerms then it was "Out of PTYs" but Ithink this was
>something else. It wasn't out of memory though, somehting else.
>What is a PTY?
A pseudo terminal. It's a way of connecting between a program (like the shell
that runs in the Xterm) to an i/o stream other than a physical one,
like the console or serial port. The PTY connects between XTerm and
the program in the XTerm window, and XTerm passes on key presses that
are passed into its window by the window manager.

>Where can I find applications compiled for MiNT X? I got it from
>ftp.cnam.fr, and there area fw on there.
I got things from phlem.ph.kcl.ac.uk, but I think its closed now. Try
Atari archive.

Bye!

SPL is the early 8-bit file sample format used by AVR in their samplers.
It was replaced with the AVR file format. SPL can be loaded by the newer
Replay 16 and probably other samplers, it's a fairly standard 8-bit
sample format. Used in Replay 4 I fink.

Hi all,
I would like to buy an Epson Stylus. Does any1 know where I can get
driver for this printer ? Does somebody use it with the atari st
successfully ?
Thx a lot,
Hartwig

You can find this information on my "ATARI cd-rom FAQ" available on
ftp.cnam.fr in the directory /pub/atari/cdrom.

Just a guess: Are you sure you've set the executable flag on all your
binaries residing on Minixfs partitions?

(Can't help you with the other crashing apps -- I don't use them.)

Michael

> monitor with them disconnected?

I'm sure I will be jumped on if I am wrong, but I _think_ they demagnetise
the screen. My monitor once developed a fault where strange blotches of
colour slowly appeared on the screen - the engineer fixed it by replacing
a dodgy cable to the degaussing coils.

I thought the TT had a fan behind the hard disk? Isn't that why they have
an extra fanhole just like the PSU one? I'm annoyed that my MegaSTe doesn't
have a hole in the back of the HD, but then I guess the noise would be incredible!

S.Lai

P.S. There's *plenty* of space for a fan. Get one of those 486 CPU fans, they
can tap off power from the HD supply. I looked in horror when I got my hard disk -
there's room for at least TWO of them in my machine!

Thank's for everyone who has offered suggestions to these strange disk problems on the TT, looks like I'm not alone!

I tried another drive, but it did not seem to cure the problem. It seems that it's heat related, so I am going to fit a small fan behind the harddrive (there's just enough space in the case). As far as screening is concerned, I removed the video screening as my graphics card get's very bloody hot! I think this is probably not helping the disk drive. In addition my 1GB conner get's Hhhottt! Well, Atari certainly know where to cut the corners! Suprised they bothered putting a fan in the PSU!
So, any TT owners out there beware! FOr starters, I DONT put my monitor on top of the computer! Perhaps I should put a 12inch fan on it!

Simon.

3555. TT floppy drive problems, the story so far...

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-04 00:00:00 UTC
From: "Dr Simon G.K. Williams" <williamssg@cf.ac.uk>
Message-ID: <DEDzCE.AMt@cf.ac.uk>
Source record: 24674

For those of you who haven't followed the thread on problems with TT floppy drives, or for those who are interested in what the problems are, here's a summary of my original problem posted and replies I have had.

Right, well here's my problem at the moment ;

Essentially I have no problems reading floppy disks, and if I write to floppy disks (even with verify on), I don't get any errors. Also no problems formatting disks. But, after using the computer for several hours, quite a number of files after being written to disk don't load back in. For example picture files either become corrupted at some point or fail to load, programs report as being not executable, midi files are corrupt, yet strangely enough ascii files never seem to get into problems. These were the suggestions offered to me from several people :-

1. The AJAX chip may be loose in its socket, over a period of months it can slowly work out due to heat and often will introduce the problems described above. Simply ensure it is pushed in firmly.

2. Problems with head alignment on disk drive, more noticeable on write than read. Possible cause .. dust

3. Interference. Once person who places his monitor on top of the TT said that moving his monitor a few inches cured the problem! Might be lack of screening in this circuitry.

Well, in addition to these points, I suspect my problem is heat related. If I leave the lid of the machine, it doesnt seem to develop. Above the floppy drive components of course is the hard drive, mine a 1GB conner gets VERY hot. Also under this is the ST ram board (also a warmy) and to the left of this lot is the matrix graphics card, that's hotter than the sun! So, with very limited ventilation in this area, what with the nest of ribbon cables for floppy and harddrive, I suspect it get's too hot for the possibly rather temperature sensitive components of the high density interface.
Well, my only thought is to add some ventilation at the rear corner of the machine and to hopefully incorporate a small fan, perhaps on the top cover behind the harddrive, or on the rear of the case. Strange, but after resiting some of the cables and the weather cooling off, the problems arent apparent at the moment! The quest continues, and, to all TT owners with similar problems, I'll keep you posted of the developments in this corner!

Cheers,

Simon.

From the Holy Book of <42805f$h6m@status.gen.nz>
as spake by mbecroft@iconz.co.nz (Mario Becroft) :

>Ben Bell (bjb@praxis.co.uk) wrote:

>Ok. I found some fonts. But things like Chimera are all setup for thses
>Helvetica fonts. I can't find these Helvetica fonts. Are they available,
>or do I just need to change the configuration files to use the ones I
>have got?

ftp.x.org:/pub/R6untarred/xc/fonts/ should have all the fonts you need.
You'll most likely need the ones in bdf/100dpi; the Helvetica ones are
helv*.bdf.

>: DLL system (come on you MiNT guys... :-) so you may only be able to

>What's a DLL system?

Shared libraries, basically. This comes up every six months or so on
the MiNT mailing list [about the same time as built-in virtual memory
and non-blocking fork() ;)]. The idea is that you have one copy of
the X library code in memory and several programs sharing it --- a
substantial savings, as the X library is pretty !@#$ing big.

> I ran about 8 applications at once, then it said
>that it had run out of <something>. I forget what it was now. I know that
>I could only run 2 XTerms then it was "Out of PTYs" but Ithink this was
>something else. It wasn't out of memory though, somehting else.
>What is a PTY?

Pseudo-terminals --- simulated devices you can attach a program to so
that it thinks it's talking directly to the keyboard and screen. They
show up as /dev/ptyp0 and /dev/ptyp1. You can create more of them by
running pty multiple times as you start X.

>: >Is there a MiNT X available that will work in 16 colours? What about one
>: >that just uses the VDI, eliminating these silly problesm all together?

>: Nope... neither.

>What a pain. Well, is it possible? If it is, somebody must have done it
>somewhere. I can't see why it would not be possible.

Well, X for Linux68K supports color IIRC, so it's possible, at least in
theory.

> I think it would be
>great to have X11 running in a window under GEM (this should be possible

>too, all the parts of X11 that draw to the screen would just need to have
>some additional handling put on them.)

Well, it's not quite _that_ simple. Basically, you'd need a special
window manager that lived in a GEM window --- or if you wanted to get
fancy, perhaps a GEM replacement desktop that could act like an X window
manager.

>Where can I find applications compiled for MiNT X? I got it from
>ftp.cnam.fr, and there area fw on there.

You could try a.a under Mint/X11.

3559. Running a terminal on my ST

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-04 00:00:00 UTC
From: steve@bpfd.demon.co.uk
Message-ID: <810236490_OASIS_@bpfd.demon.co.uk>
Source record: 24678

I have 2.5Mb STFM with HDD and Mono monitor running MagiC, Thing, NVDI and
others.
I also have a Cambridge Z88 with the bare minimum of memory and no peripherals

I would like to use the Z88 as a terminal on my ST. I have got them
communicating through a terminal program on each computer, but what I really
want to do is to redirect the inputs and outputs of a TOS program which I can
write myself in HiSoft Basic to the Z88.

My aim is to write some simple POS and stock control software on my ST and then
use the Z88 on my shop counter as a POS terminal.

So is there an easy way to do this or do I have to code the entire program
differently, writing directly to the serial port rather than just using PRINT
and INPUT?

I _think_ this could be done using MiNT but as you can see I do not have a MiNT
system running - it is all MagiC based, and I would really like to carry on
using my computer with this POS software running in the background.

Any tips greatfully appreciated!

: or do I just need to change the configuration files to use the ones I
: have got?

Either edit /usr/lib/X11/app-defaults/Chimera & change the font settings, or perhaps you need to create a "font.alias" file in each of the font directories. Under Linux, "mkfontdir" will help in making the "font.dir" files - has this been ported to MiNT?

: 4MB ST RAM and 4 MB TT RAM. Doesanyone know ehether X works with outside
: virtual ram?

It should do.

: What is a PTY?

Pseudo tty. IIRC there is a prog that needs to be run to make more pttys for Mint.

: Where can I find applications compiled for MiNT X? I got it from
: ftp.cnam.fr, and there area fw on there.

If you can compile prorams your self, there are plenty of source in the Slackware distribution :-
src.doc.ic.ac.uk:/packages/linux/slackware-source-mirror/xap

3565. Various TT problems: HD floppy & blitter

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-04 00:00:00 UTC
From: azog@gti.gti.net
Message-ID: <42fnp1$1cs@gti.gti.net>
Source record: 24684
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I have a TT that's acting up in several annoying ways.

First, the floppy isn't working correctly. The machine was originally TOS 3.05, but was upgraded to a WinX patched version of German 3.06, and has the upgraded floppy controller chip (AJAX?). I can read high-density floppies created on my Falcon, but cannot read double-density (720k) floppyies created on the same machine. Nor can I even format floppies at all. Running Profiler 2.4 tells me that drive A: is a high-density floppy.

I tried to install a new drive mech. to test it out, but the system doesn't even recognize that a floppy exists with this new mech. I know the drive mech. works fine, since I also use it on my 486 system. When I power the TT on (with the new drive mech. in), the drive light glows real sickly (weak). When I try to access A:, I get "drive A: does not exist". Is there any thing I should be aware of when replacing the mech? I noticed some jumpers on both the old and new, but they don't match. Even when I matched them up, it still doesn't work.

Also when running Profiler 2.4, it tells me that there is no blitter installed in the system. I thought these were stock on TT's? I didn't see any empty sockets when I opened the machine, so hopefully this doesn't mean that I have a bad blitter!

Finally, does anyone know of a way I can get hold of a English (american) TOS 3.06? Call me a purist or anal retentive but I like to have things like this as original as possible.

I thought of that - but my TT's monitor is 'miles' away. I do have a 14"
multisync on top of the TT's case for use by all my machines - but the TT
has the problem even when the multisync is off.

I think I'm going to have to put the sheilding back in.

:-)

From what I've heard - MiNT *does* support VM - though MiNT-X is none too happy with it. Also MiNT likes more than 4Mb of real memory before you start turning on the VM.

All in all not a particularly useful combination.

:-(

But presumably Outside needs to intercept the memory (de)alloc routines so
that it knows when an access to non-existant memory occurs. And how does
the OS allocate more memory than is available without help?

Cheers,
Simon

I would use an extra power supply to drive your drives. IMHO the Falcon
power supply is rather weak (or just engineered to drive what's inside
only). You may want another fan, but that doesn't matter.

You can just put the drive in the case and have at it, but beware of
mating cables. Hopefully you're already aware of the difficulties:

The Falcon connector is a 50-pin mini centronics. While this is standard
enough in many systems, matching it to something is sometimes an adventure.
If you want to simply cable the Falcon to a bare drive, you'll need some
conversion in the middle. SCSI drives uses 50-pin dual header connectors.
What I have is a cable on my Falcon that goes to 50 pin standard centronics,
and then another cable that takes the centronics to a 50-pin dual header,
so I can plug it directly into the drive...

Some shoeboxes have internal cabling so that the external connector is
already in the proper type and gender, so that would negate that problem.
I run my drive bare (who cares how it looks, it works!), so did a little
cable gymnastics.

Geez, I hope that above paragraph makes sense!!

3571. REPOST: BLITTER UPGRADE..

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-04 00:00:00 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <09041995.204640@empyr.dircon.co.uk>
Source record: 24690

Hi,

Sorry to repost this but I have had no replies yet, and this blitter problem is annoying me !

I have tried adding a Blitter chip to my 520 STFM, but when the chip is in place, the ST won't boot at all, just a black screen (mono).

My system is :

520 STFM, 4Mb Marpet XTRA-RAM Deluxe board fully populated, TOS 1.4 upgrade (it originally came with 1.2). Everything else is standard.

I had to fit a socket for the Blitter and I have triple checked for dry joints etc. I have removed the solder pads on points W3 and W4 (blitter enable points) and installed the chip the correct way around.

Does anyone know if a Blitter will work with TOS 1.4, and if there is any way to test it. I have an Oscilloscope if that makes any difference.

Many thanks in advance,

Cheers,

Kev.

Hello,

I've recently built my Falcon in a Lighthouse Tower, and now have
the room to spare at last for an extra HD. Can I simply buy a bare
SCSI drive with the appropriate SCSI2-cable and put it in? This would
save about 75$ on the casing - BUT, some Tower vendors are offering
`SCSI kits'. What's in them? What extras would I need? If it's just
a power supply and some cables, could I simply use the old 260ST
powersupply I've got lying around, if the Falcon's original PS can't
take the drive? Extra fan? Anyone?

Please help me out - I have about 2 bytes to spare, and then my HD
is _FULL_.

Regards,

It's OK, Dan - you are definitely RIGHT! I have sussed things out now and got the coils and monitor working again.

Just behind the screen is a shadow mask screen which is ferromagnetic. It is this which has to have its magnetisation reduced to zero by a high 50 c/s field at switch on which then decreases to something small over a couple of seconds.

What does it emulate? You need a driver to suit this. Probably Epson 850-LQ
is one of the modes - drivers for this are everywhere.

BTW, the Epson is a good choice - nice technology, nice printing.

On 04 Sep 95 alan@browns.co.uk wrote:
a> Does anyone know about any links to be made / broken, or perhaps
a> the XT
a> chips are too slow??

Unlikely to be too slow. A 8Mhx ST will work with RAM at 150ns and below. There should be a number on the chips 70, 80, 100, 120, 150 etc. indicating the access time.

Been a while since I did a memory job on my PCB but the three important signals for Bank 1 are RAS1 CAS1H and CAS1L which, on my PCB are labelled and are around the centre of the board (my PCB is one of the original 512Kb only - not even positions for the second bank). Also, eack RAM chip should have a decoupling capacitor of about 0.2 uF connected between 5v and ground. For cost reasons these may have been left out on the 512K model.

a> The ST still works fine with 512K.

Yup. The TOS knows there is more than 512K connected but it is failing the memory read/write check - I guess it could be lack of decoupling which is causing the prob. as the extra 512Kb is obviously addressable.

No blitter in a TT at all. The machine is too fast for the standard ATARI
blitter AFAIK. Just add NVDI if you want a little more speed.

:-)

Most likely.

> starters, I DONT put my monitor on top of the computer! Perhaps I
> should put a 12inch fan on it!

I tried mounting a small 8cm equipment fan on top of my TT to blow air down onto the circuit board. Unbelievably ineficient and a total waste of time!

I had previously removed the internal PSU and replaced it with an external PC one. This time around I blocked up all the holes in the case which weren't proper air vents (to force the air to be drawn over the circuit board) and removed the plastic grill behind where I had left the original PSU fan.

It was also at this point that I took the speaker and VME slot shieldign out.

Seems to have done the trick as far as TT-Hi shimmer is concered - though my floppy disk is fussier than it was.

:-)

Roland.

Early TTs did have this second fan - but my 1992 one had exactly the same arrangement of PSU and single fan that my (now sold) 1992 MSTE had.

Its not even easy to fit the fan behind the hard drive as the shielding covers the back panel and the circuitry goes right up to the sheilding.

Phlem is indeed dead. I've moved to work at Logica now, and my wonderful supervisor decided that the ftp site was a waste of space. He removed he thought was related to me. Sorry guys - nothing I could do.

I have a DEC alpha here at Logica, but the firewall people seem fairly keen to only allow what they want through, so it looks like I can't set up a second site.

ATB,
Simon.

All PC disk drives has to be jumpered (?) as drive 1 (one). You do this
choosing Drive Select 1 (one) with the jumpers.
The Atari needs drives that react as drive 0 (zero). So you have to chance
the jumper in the drive you got from your PC.
I'm not sure ybout it, but I can imagine that the floppy controller needs
the information if there's a DD disk inserted. You may reach this setting
the right jumper in the disk drive.

: Also when running Profiler 2.4, it tells me that there is no blitter

The TT has _NO_ Blitter. Due to the new Video System and the higher clock
rate on the bus the blitter would _slow down_ the speed.
BTW: TOS 3.06 still supports the blitter. You may see this when you use a
68030-Card with TOS 3.06 in you ST.

: Finally, does anyone know of a way I can get hold of a English (american)
: TOS 3.06? Call me a purist or anal retentive but I like to have things

Outside works with a plain MultiTOS system. It doesn't work on
a MiNT/MiNTOS/minixfs/MiNT-NET system, and certainly not with X-Windows.
Shame really.

3584. Big IDE Disk Problem on Falcon

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-05 00:00:00 UTC
From: Matthias Helge Hennig <hennimba@rz.ruhr-uni-bochum.de>
Message-ID: <Pine.HPP.3.91.950905144807.8453B-100000@hp138.rz.ruhr-uni-bochum.de>
Source record: 24703

Hi, everybody!

I got an IDE-Drive (850 MB, "new" IDE-Connector, whatever this is...) and tried to connect it to my Falcon. The only thing that works is to format it with HDX (in Master/Slave mode with a second Drive). Then everything works fine (booting, r/w etc..) until ... I switch off my computer. After that nothing works (of course I switched on my comp again!), HDX responds with "Root Sector unreadable" and after formating the drive again, it works until ... well, we had that.

I hope, somebody knows something abaout that,
Matthias

AM> fine with them in.

What you need are 256kBit * 1 Chips, called 41256 or similar. Yours might
be compatible, although I can not tell from the number you give.

AM> After obtaining some very similiar chips from an old XT board (417128?)
AM> and carefully inserting them into the sockets, the ST refuses to start.
AM> There is always a family of 2 to 20 bombs on the screen and usually
AM> colour washes too! (Very good for a graphics demo I'm sure!)

You need to check if the RAS/CAS lines are connected. You might need to
fit 2-3 68 Ohm resistors on the PCB in the traces between the RAMs and
the MMU. Look for 2 or 3 68 Ohms resistors on the PCB with vacant space
for more resistore beside.

AM> Does anyone know about any links to be made / broken, or perhaps the XT
AM> chips are too slow?? The ST still works fine with 512K.

150ns Chips are maximum, faster is OK.

AM> There are three (256/1024) links on the board, all of which are set to
AM> 1024, but I think they are for the ROMs.

Right.

You can move files with GEM desktop by holding down the control key (if my memory serves me) as you position the selected files over the destination directory. Simply select the files as you would normally, and then drag to where you want them moved to and hold down the control key as you release the mouse button. This should give you a panel where 'move' replaces 'copy' assuming you have 'verifies' set to on (prefs pulldown menu).
You can rename folders by selecting them and then pulling down the 'show info' menu. You should then be able to click in the folder name and edit it.

You mostly access memory between the allocation and deallocation calls,
you know. What you are suggesting has no chance of working.

>the OS allocate more memory than is available without help?

But the memory _is_ available. At least as far as the OS is concerned.

A simple explanation of how virtual memory works:
- Some hardware inside the '030 checks the address of _every_ (logical)
memory access and changes the address to the correct physical RAM
address (they do not have to be the same).
- If the processor decides that the requested logical address is illegal
(not mappable to RAM) there will be a bus error.
- Outside traps the bus error, makes room for the missing memory block
(possibly by writing another block out to disk) and loads it into RAM.
- Finally the execution of the instruction that caused the bus error is
continued.

This is not simple at all and requires that the processor has the ability
to continue (or restart) an instruction that accessed unavailable memory.
The hardware must also be capable of remapping memory addresses on the fly.
The 68000 Ataris can't do either and can therefore not use virtual memory.

Yes, your Lighthouse manual should include details of SCSI drive
installation.

> This would
>save about 75$ on the casing - BUT, some Tower vendors are offering
>`SCSI kits'. What's in them?

Typically: SCSI connectors (50 way Centronics and DIN), internal
ribbon cable to drive, and power supply.

>What extras would I need? If it's just
>a power supply and some cables, could I simply use the old 260ST
>powersupply I've got lying around, if the Falcon's original PS can't
>take the drive? Extra fan? Anyone?

Some of the older drives require more power on the 12V line than a ST
or Falcon power supply can provide.

The fan may be required depending on your drive, I have an IDE drive which
just doesn't get warm, and a big SCSI drive that you could fry eggs on.

Source record: 24710

Hi,

Further to my plea for help in getting my Blitter upgrade to work, there is now no need for any assistance...it works !

The problem was an intermittent connection on my Marpet XTRA-RAM board which just happened to go away when I removed the Blitter after thinking the Blitter was bad.

I have seen a few of these Marpet Boards go funny, especially the solder joints, they seem to oxidize and leave salt residues. Anyone else had similar experieces with them ?

RIght, now I am fully Blitterised, erm...what improvements am I supposed to be seeing ? So far, the only difference I can see is a small increase in performace of the Gem Draw routines, and then I only discovered that by running QuickIndex !

I was rather hoping it would provide a similar performance increase as NVDI has already done to my system.

Thanks to everyone who replied.

Cheers,

Kev.

How far has anyone gone in upgrading a plain vanilla Atari ST ?

I would love to hear of some 'Monster STs' in existence !

Not that I stand a chance of holding the title of
'Monster ST of C.S.Atari', but I'll start the ball rolling with my current
setup:

Started off as: Atari 520 STFM, TOS 1.02, 0.5Mb RAM, bugger all else.

Current upgrades: 4Mb RAM on Marpet board, TOS 1.04, Blitter Chip, Mono &
Color monitors, 105Mb and 20Mb SCSI-2 hard drives,
AdSCSI+ host adaptor with real time clock, 9600 baud
modem and Audio Out from monitor socket going to Stereo
Amplifier. Plus Maxtor 800Mb optical SCSI WORM drive
waiting to be connected as soon as I can get the media !

So....come on, I'm SURE there are much higher spec STs out there !!!

Let's hear from you ! (..and be HONEST ;-)...also only equipment you
already own can be counted. (I was going to say *already connected*, but
then that would have excluded my WORM drive ! ;-))))

Kev.

I don't want to sound nasty, especially since I am asking for help, and
you were kind enough to reply. But you apperently didn't read my entire
post, or missed the point:

The floppy can read previously formatted HD floppies, so the switch
on the main board is set properly, and also implies that the cable is
connected properly. You don't know me, but these are the things that
I would normally check before posting for help...

I was able to make some progress with it today. There are a series of
jumpers on the drive, and I just took each position and noted the
behaviour. I was able to get it to operate in the reverse manner!
Prior, I could read HD flops, but not DD. Now I can read DD but not
HD! Odd thing is, now I can *format* HD flops, even tho I can't read
them afterwards. Still can't format DD flops...

I am thinking of just putting the old controller chip back in the machine
and dealing with it. This is a bummer, tho...

:
: What is the drive model number?

The original drive, which I have a feeling may be bad, is a Teac FD-235HF.
The drive I am trying to work with is Mitsumi D359T3.

s> could I simply use the old 260ST powersupply I've got lying around, if
s> the Falcon's original PS can't take the drive? Extra fan? Anyone?

Depends on the drive - if you get a modern one it won't need much more than
20 watts. I doubt whether the Falc. supply will be happy with this but the
260ST PSU should cope provided the 12v line can deliver enough.

How much room have you got in the tower? If you are likely to carry on
chaining SCSI devices it may be a good idea to get hold of a used PC PSU
(around 200 watt) and bung this in. Don't bother with a fan unless you have
trouble later. Again, if you get a modern drive (and it's not absolutely
enormous) the dissipation is very low.

Actually, I've got a drive that doesn't work with my MSTe adapter, and it works with my MSTe adapter. Apparently, the mistake from Atari's side is that they forgot to put the "power good" signal on pin 40. If you life your harddisk up, count to 40 from the left to to 10 from your right on the flat cable. Isolate it by carefully cutting between wire 39 and 40 and between 40 and 41. Then cut off wire 40 and add +5V on the harddisk side of the cable, so that the disk gets the signal it wants. Voila! It works! (Thanks to a lot of people for giving me the solution to this problem. ;^)

From: mbecroft@iconz.co.nz
Message-ID: <42iqnj$i5a@status.gen.nz>
Source record: 24718

I have now got the apps to load under FreemiNT (it was the permissions), but now I find that certain apps just hang for no particular reason under FreeMiNT.

For example Thing crashes after selecting a couple of objects in a window (but sometimes I can select 10 somtimes 1 and so on.) ESS Code 6.3 would seems to crash frequently when quitting.

The computer just hangs alltogether and I have to reboot.

This has only started happening after another user sent me a patched FreeMiNT which had an FLock (?) bug fixed. Apparently it was just one line changed. Well, this seems to be what's causing the trouble. But if I use the old version of FreemiNT 1.12.4, which does not have this patch, then smail doesn't work, which is no good either.

Thanks for any help!

3600. [Q] How to change MTOS "desk menu long name" of another app?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-06 00:00:00 UTC
From: mbecroft@iconz.co.nz
Message-ID: <42ir6k$i5a@status.gen.nz>
Source record: 24719

Under MultiTOS, the name of an app. appears under the desk menu when it is loaded. Using the menu_register() call, this name can be changed to a more descriptive one, rather than the filename.

However, many apps do not do this, esp. older ones.

I am trying to write an application which will set the "long name" of an appliaction other than itself.

I tried using appl_find() to get the apid of the application who's name needs changing, then calling menu_register() and passing that apid to it. It worked! So, I tried it on another application just to be sure, and it had no effect at all. I then tried it on the application that it worked on to begin with, and it didn't work here any more either. Since then, I have been unable to get this method to wrk at all :-(

Does anybody know how I can do this?

Thanks fo any help.

How do you just "bung it in"?
I have looked at the connector on my (dead) falcon PSU, my ST's and a PC's.
They all have different connectors.
Tha falcon (which I need a PSU for) has eight(?) big pins, the ST had
eight(?) small pins and the PC had two sets of six big pins.
(I may have the numbers mixed up but they are all different.)
So, what do I get? I suppose it's possible to solder the wires to the
right places, but I can't do any soldering.

I would like a PC supply as I need one for a couple of SCSI disks, but
from the power supplies I have looked at, I may need to get a falcon
supply and a PC supply.

Help!
Phil

>
>

No need to use MiNT... If your TOS-program uses standard out to write to the
screen and std. in to read from the keyboard, you can redirect them to the
COM port. (Or is it called AUX on the ST? - I'm not sure.)

The easiest way I can think of is to use a command line interpreter, that
permits redirection of std. in and out. It could be done with a command line
such as...
myprog < COM: > COM:
.. where "myprog" is the name of the program you want to run.
A good idea would be to run the CLI again, with the output directed to the
terminal. That way you could lounch other programs from the terminal.

I can't reccomend you on wich CLI you should use, as I keep forgetting
what they are called.

And finally... be sure your Z88 is running an vt54 terminal emulator if your program uses control codes.

Hope I could help

PS. I have never actually tried this, but I'm preatty sure it'll will work.

I've had a couple of instances recently where the STM refuses to boot or gives about 500 bombs while booting. This IS a store problem but haven't diagnosed, yet, whether it's my re-engineered Bank 1 or the Marpet board which makes up Bank 2. My gripe about the Marpet board is that the plastic clips which retain the SIMMs are very insubstantial - one of mine has broken off so it could well be that I am getting an intermittent through lack of retaining pressure.

I used my MEGA/STe for years without tampering with any extra fan. The built-in one seems to be okay for the job, but after years of use it gets noisier.

I never installed a regulated fan into my machine, but it *is* a good idea, if you want to keep noise down.

Hi Hartwig,

> I would like to buy an Epson Stylus. Does any1 know where I can get
> driver for this printer ? Does somebody use it with the atari st
> successfully ?

Certainly! One choice is Imagecopy 4. It supports all sorts of printers,
including the one you mention. Imagecopy has gone from strength to strength,
and version 4 (especially the CD variety) is a masterpiece!

There is also an Epson Stylus printer driver in Calamus SL, but this works
only with the Oct/Nov'94 release of SL.

Positive Image (coming soon) supports the Stylus as well. PI supports almost
anything actually...

Aproximate prices:
Imagecopy 4 DM 88,-
Imagecopy 4CD DM 100,-
Calamus SL DM 500,-
Positive Image DM 170,-

Hope this helps.

Say hello to Germany from me, will you?

A driver comes with NVDI 3 and Papyrus also has it's own Stylus printer,
but if you're stuck for either of these I think an Epson LQ drivers will
work.

As for quality, mine is variable, especially after an ink cart change, I
often get streaking on the paper (I'm using inkjet paper) which I think
might be caused by paper dust on the print head. Cartridges are cheaper
than HP Deskjets, but don't seem to last as long.

If you can afford the extra, get a laser - they tend to be cheaper in the
long run.

Phil.

3609. SCSI-drive order & id's

Newsgroup: comp.sys.atari.st.tech

A quick question:
does it matter in which physical order you put the drives,
if you have the id's set correctly?

In another words: if SCSI drive (id 0) is connected to the cable
connector that's situated *after* SCSI drive (id 1)'s cable connector,
and id 2 after id 3, etc - does the SCSI chain work?

Just like to point out that MaxiFile does folder renames on TOS < 1.04
by copying the folder to the new name, then deleting it. This is very
slow on floppies...

That said, MaxiFile is the most-used commercial app on my harddrive.

Wot???

I don't beleive *one word* of the above! The Epson Stylus is an extremely
powerful printer, producing glorious colourful results at 720dpi!

The Epson 850-LQ is something far more simple, like 24 pin dot matrix and
stuff...

> BTW, the Epson is a good choice - nice technology, nice printing.

I agree to that! And with a sensible price tag too.

Stay cool everyone!

Unfortunatly, he does not have the correct TOS version for those desktop features. That is why he is asking the question.

IIRC, he has a pre 1.4 version of TOS. No move command. No folder rename.

SR>But presumably Outside needs to intercept the memory (de)alloc routines so
SR>that it knows when an access to non-existant memory occurs. And how does
SR>the OS allocate more memory than is available without help?

No, it does not need to do so - get some book on virtual memory
management.

Outside simply enlarges the addressable memory space (eg. from physical
4MB to 8MB). TOS now thinks it has got 8MB and uses it as it would use
real 8MBs of memory. Now whenever a program tries to acces a page in
memory that is not physically present, a page fault is generated and
another page is swapped out to disk by Outside, the contents of the
needed page are swapped in from disk and the page is mapped to the
correct virtual address - voila.

Neither the TOS nor application programs will see the difference to real
memory (except for the speed and some rare cases, eg. stack access to a
swapped out page, which are prevented by Outside).

I've aquired an Epson SMD-300 disk drive (3.5"), but I'm a little
confused about the DIP switch settings.

Can someone please tell me what the different jumpers are for?
I need to get a density "high/low" signal out from the drive
depending on which type of disk is used.
I'd also like to hear what other experiences people have with this drive-
durability, reliability etc.
Thanks.

3618. *.ttf fonts and NVDI - font damaged?

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-06 00:00:00 UTC
From: macdonald@cfcsc.dnd.ca
Message-ID: <macdonald.115.000B341A@cfcsc.dnd.ca>
Source record: 24737

I have copied *.ttf fonts from my CorelDraw CD-ROM to my font directory on C:, but when I reboot and NVDI reads them it says the fonts are damaged! Since they are the same size/date/time that is unlikely. Scanning them from the NVDI XControl panel CPX doesn't give me any message at all. I've tried a suggestion from Al Fasoldt(sp?) to put 'check_fonts = 0' in the last line of my NVDI.INF file, to no avail. It still checks the fonts, and reports them damaged. Does anyone have an idea of the header that NVDI expects when it's scanning fonts? maybe I could change the present header to the appropriate one and solve this problem that way.
This is tad frustrating as Speedo5 never had this problem! Perhaps I'll have to abandon the GDOS part of NVDI in favour of Speedo5.
Any help appreciated.
merci.thanks

SB> but after years of use it gets noisier.

Sven, sorry if I'm off-topic,

I did (or have done, am doing :)) the very oposit. I cut the cord from that _very_ noisy fan in my Falcon. I don't use a fan for my external SCSI. Now I _hear_ what I'm doing on that D2D thing of mine :) It's not remarkably hot, warm but not overheated. After all a car is running better in a certain temperature. So does electronic equipment :) I've never had any problems. I used to run a BBS on a Mega ST4 a couple of years ago, 24 hours a day for several years, just the whirl of the spinning HD and it never broke down.

SB> I never installed a regulated fan into my machine, but it
SB> *is* a good idea, if you want to keep noise down.

I suspect that the noise will come when installing a fan fitted in either a Falcon or a Megafile cabinett. You used a RLL/MFM that are much more "heataware". Nowdays a SCSI or even a IDE doesn't require a fan.

Even if my 1.8GB should break down I know that I had such a pleasant time lacking that fan noice. But I could install a temp. regulated fan. Hmmm.... have to think about that :)

Erm,

Teradesk uses less memory than Gemini & Kaosdesk (don't know about t'Thing
though)

If you have (like me) an early tos version. Why should I get 1.4 roms?
-Compo are, I believe, selling 1.4 for 19ukp Magic for 59 ukp

So, if you can afford it, Magic solves all problems, and more.

Or does it? My point is- does anyone need to buy or fit tos upgrades as well
as installing Magic, is there any reason to?

3622. Help finding tv-video monitor conversion box!

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-07 00:00:00 UTC
From: lderbery@wam.umd.edu
Message-ID: <42n85d$lo5@cville-srv.wam.umd.edu>
Source record: 24591
Cross-posted to: comp.sys.atari.st.tech,rec.games.video.atari

A friend of mine has a problem. He used to own an Atari 800 and now
he wants to get a 'converter box' (his term) that one can plug in to the
video input to let the monitor be a tv. It is an old monitor that uses
'chroma' and 'luma' inputs, and he says the atari catalog used to list
just such a device.
The monitor is a Commodore 1702 Video Monitor w/ video & audio inputs
on the front and chroma, luma, and audio inputs on the back, with a fronty
mounted toggle switch to choose front or back inputs. (in case that helps)

If anyone knows how to get or make such a converstion device, please
respond to me via email.

Thanks,
Linoleum Man

No

Any old order will do - as long as the termination is still correct (ie
terminate the last in the chain - *not* the highest numbered id).

:-)

Hello Pekka,

It does not matter in which physical order the drive IDs appear on the SCSI bus, and your example above should work OK (as long as the bus remains terminated at both ends).

There's Speedo GDOS drivers also available for the Epson Stylus color, try hensa.micros.uk or any other main archive.

Incidentally I use the Epson Stylus COlor on my Atari TT, imagecopy produces far better output than the windows drivers on a pc! Also I've got the driver pack for Calamus SL, p.s. you don't need the latest version of calamus for 720dpi output, there are 2 versions of the job module available, depending on which version of calamus you use. For really good output on calamus, you need the star screening module.

Also NVDI3 supports the epson stylus and stylus color, i.e. via any gdos application. There are also drivers now available on the latest versions of DA vektor, DA vektor pro, DA's picture and probably DA layout!

Simon

Nope - I was trying to make use of the existing vent slots. They are just
not big enough though - and I didn't really want to cut the top of the case.

p> falcon supply and a PC supply.

Ah, sorry, Phil. My response was only concerned with powering the SCSI devices which, of course, have standard connectors and will mate with the ones sprouting out of a PC PSU. You can buy "Y-splitters" if you have more devices than connectors. There is also, usually, a small 4-pin connector for a 3.5 in. floppy.

I didn't realise you had a dead Falc. PSU. Not familiar with the insides of these machines. When you say it has pins do you mean they are the sort which will take a connector (preferable) or do they HAVE to be soldered?

The ST has 6 pins because it doubles up on the high current leads for +5v and ground. I have the diagram if you need it.

It's a bad idea to get both a Falc. supply AND a PC PSU (cost, space etc.) as there is no doubt the PC PSU will supply the Falc power once you have it sussed out.

Why can't you do soldering? It may not be necessary as many connecters use crimped joints (squeeze with a pair of pliers) but I usually prefer to solder critical bits like this. You would also need access to a primitive voltmeter to check the PC rails. I can't remember the coding exactly but you can bet on RED +5v BLACK Ground YELLOW +12v. (I think -12v is BLUE, but don't take my word for it!).

Go for it, Phil. You can get a PC PSU (out of an old case) for around £15.
You will then have enough money left over to buy a soldering iron and voltmeter!

Well, if you'll want a text only editor, I'll recommend ME (the Mutt
Editor). It's very simlar to Emacs in use, but considerably smaller and
IMHO easier to 'install'. I like these Emacs style editors as they
buffer keyboard input intelligently (ie. output to screen only when
they have time (eg. when scrolling down etc.).). I have compiled v3.5
(base relative version) of ME (150k) on my WWW page
http://modeemi.cs.tut.fi/~puujalka. There aren't sources as my
harddrive chrashed before I had time to do that. The original Unix
source (GNU copyleft) are available from the ME author's ftp.site.

720Kb disks formatted for DOS can usually be read/written to by an ST.
PC's and ST's use the disk in much the same way, and can read/write each
other's directories, text files and some data files. For instance, a Lotus
file from an IBM can be read into LDW, and edited, etc. The resulting
file cannot be read back to Lotus, unless it is run through the convert
prg. Word Perfect can export a DOS text file which can be read by most
Atari word processors, or even from the GEM desktop. MaxiFile, and TLC
formatter (and probably others) will format DOS compatible disks on an ST.
I frequently have to import text and data files from my wife's PC, to
do DTP or data functions on Atari.

Well, I figured out what I was doing wrong. I had used the environment variable RESOLV_CONF_FILE (I believe that's the name, I'm not at my computer at this time so I cannot look it up) to relocate the resolver config. file from u:/etc/resolv.conf to c:/mintnet/resolv.cnf. Unfortunately, either the resolver wasn't paying attention to the variable or the variable was being set after the drivers were loaded by MiNT. Result: No config. file (as far as the resolver was concerned) and therefor no nameserver.
I put the file in /etc/resolv.conf and all was well.

Thanks for everybodies help.

3643. degaussing coils

Newsgroup: comp.sys.atari.st.tech

r > What are the degaussing coils for and what probs. will I have i
r > monitor with them disconnected?

They keep the picture tube from becomine too magnetized in one area of the tube. if this happens, you will get colour blotchs on the screen, and or uneven color througout. Running without it.. may or may not cause you a problem. TVs never used to have them, and we used to have to use a degausing ring to solve the problem I described as part of servicing them. I'm unsure if anything will result in a monitor though, but seeing as they are mroe or less a TV without alot of parts, the results should be the same.

I am now on my 3rd replacement 270 drive and it has just crashed within about 10 minutes of operation. And this is the new enhanced drive. It spins down and up again at random even when you are not using it and it also does the same but alot more when you are reading/writing. This is a real bummer. I want to meet other people using this drive.

I have used it with HD driver and AHDI, also the LINK 2, all to no avail. It is in the recommended list of drives to use with Cubase Audio, so if you are using it please get in touch.

>for a 3.5 in. floppy.

A PC supply can power my HD's, monitor and floppy no problem, I just need
one will will power the main board too! :)

>I didn't realise you had a dead Falc. PSU. Not familiar with the insides of
>these machines. When you say it has pins do you mean they are the sort
>which will take a connector (preferable) or do they HAVE to be soldered?

It is the same *type* of connector, but the pins are larger, so an ST
supply won't fit, and it is eight pins while the PC supply I have looked
at has two connectors with six pins on each.

>Why can't you do soldering?

Well, I don't have a soldering iron, and have never tried soldering
anything before. But who knows? I may be a natural!!

>Go for it, Phil. You can get a PC PSU (out of an old case) for around £15.
>You will then have enough money left over to buy a soldering iron and
>voltmeter!

I am a bit wary of messing with power supplies. I would rather not risk
frying either myself, or the falcon. I was sold a PC supply before from a
shop (which will remain nameless) which zapped me when I switched it on.
(through the switch itself)
When I took it back, I was told I shouldn't have been sold it in the
first place as it was taken of the "broken, needs to be repaired" shelf!!
I was not impressed....

Anyway, I am still looking for a PC supply which has a connector which
will fit the falcon. I am willing to pay a bit more for it if necessary.

Thanks for the help,
Phil

I've been trying for several months now to get some
information about an IDE harddisk interface which supposedly also
works for the STe and is made by a German company called;
Gellermann & Fellmuth, which is based in Berlin.

For some reason they don't reply. I've written to them a couple of
times and someone else on the net faxed them several months ago, but
not a word from them.

So what's up with them? Have they closed down? Aren't they interested
in selling their products? Don't they do exports (even brochures)?
Has anyone been in touch with them?

Hallvard

I like using the Devpac editor - I was supprised, but it doesn't mind using long (Minix) filenames if you have freedom installed. (The full filename even comes up on the windows title.) Of course, you have to be running with GEM installed...

If anyone knows of a better (ie less specific to assembly) GEM editor that runs fine with a minix filesystem, then let me know...

3650. [Q] hardwaremod. for modemport

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-09 00:00:00 UTC
From: someone@ping.be
Message-ID: <810607768_OASIS_@ping.be>
Source record: 24619

Hi there,

I've been lurking around for a while now. The more I read these messages,
the more questions I have.
I'm thinking to speed up my modem port. For the moment I use the HSMODEM6
patch on my TT. With this alone I can't go further than 19200. Do I need
hardware to accelerate the modem 1 port or are I just doing something
wrong with the HSMODEM6 patch?
I haven't the slightest idee how the different drivers are configurated.
I've used them just like they are when I've downloaded HSMODEM6. I do have
a 28800 modem and I want to use them at 28800. Certainly now I've received my
telephonebill. It was quite a lot I can tell you that. :-((

Do you know, by any chance, the layout of the drive power socket, and
what power is needed (5 or 12)? (This might be included with the
drive docs, but just in case...) I have a multimeter, so I can figure
out the connections from my old ST PSU myself. I'd rather not use an
ex-PC PSU - my system is completely PC-clean and I'd like to keep it
that way. No second hand SCSI drives for me either - you never know
what they've been inside... :-)

Regards,

Don't abandon the GDOS side of NVDI, it's excellent and much faster than the former.
I've had a few coreldraw ttf font's give such errors, but in general most ttf fonts load without problems. Check your cache size and integrity of the files, try a few other font's to see if those ones are suspect. Failing that, let me know what font's your after and I'll see if I can help you.

Simon.

I think that you need NVDI V3.02 or higher to use 'check_fonts = 0', and you presumably have an earlier version. If not, you have possibly made a mistake in changing the .INF file. I wouldnt change to Speedo if I were you, as NVDI is better in most respects! (BTW a common problem with TT fonts seems to be that they are lacking an ID number in the header. Unfortunately I dont really know what this is for yet!).

Cheers,

Richard.

Well, I am using (bought yesterday) a USR 28.8 sportster modem on my TT.
Just connect it to the serial2 port instead of modem1. Right now, I am
connecting through mintnet slip on 115200 baud.
This will *really* save quite a bit on the telephonebill.

Erling

PCs may be bad technically but they're not infected you know :)

For me they are a good and cheap source of bits as the PC market is churned
so much they are always throwing things away.

>
>I am thinking of just putting the old controller chip back in the machine
>and dealing with it. This is a bummer, tho...

You're getting into deep trouble fiddling with the jumpers on the drive.
I did so a couple of years back and got so stressed and discouraged that
I gave it a rest. I did manage to get *one* brand of drives working after
some weeks(!) trying, and have never used any other brand since.
The trouble you're experiencing lies herein (I had the *exact* same
effects as you describe above) : When the drive has a HD floppy inserted
The drive and the computer both need to know that and act accordingly.
With the jumpers you can do this, but most jumpers seem to influence the
settings of the others. I mean, it is possible that even if all but one
jumper is in the right place, the drive still doesn't do anything...
I had a drive with 10+ jumpers. Still have nightmares about it ;-)
It gets more complicated in that TOS 2 and above have a weird way of
dealing with floppies and that PC-drives sometimes use other pins for
the output/input of the HD-signal.
See next list of possibilities...

pin 2 acts as output, Switch also used for drive.
pin 34 acts as output, Switch also used for drive.
pin 2 acts as output, Switch not used for drive.
pin 34 acts as output, Switch not used for drive.
switch used for drive, computer figures out thru software what type of disk.
switch not used, computer figures out thru software what type of disk and
a) inputs it at pin 34 or

b) inputs it at pin 2

Of the possibilities above only 3 *theoretically* could work.
In *some* system, that is, not specifically in atari's therefore.
Furthermore, if you add to this the trouble with seekrates, drive-ID's,
bad or inadequate floppycontrollerchips (not in your case as you use an AJAX)
trouble with not-recognised diskchanges under some circumstances, etc...
I reckon you will want to stay away from it.
If not, feel free to contact me, but expect no miracles.

>:
>: What is the drive model number?
>
>The original drive, which I have a feeling may be bad, is a Teac FD-235HF.

This one is a very good drive but a pain in the *ss to configure.
I never got it right...

>The drive I am trying to work with is Mitsumi D359T3.

Don't know this one.

This does not help. SMD-300 doesn't mean anything useful.
Look at the *back* of the drive instead, there is a very small label
there. If it says SMD-340 it's HD, if it is an SMD-380 it's only DD.

Glad to disagree...;)
Name me just one program that UIS v3.32 is not compatible with ?
Because I've got one for you: Try opening the texteditor in calamus S(L)
when selectric is installed. If they remove that bug from selectric and
get rid of that stupid pop-up menu for selecting drives I may consider
using it. Oh and BTW, in UIS 3.32 I can 'hide' several files at once.
Not possible with selectric. So when the time came I had to unhide 300
files... selectric saw the inside of my trashcan.
But it has great potential.

Kobold is perfect indeed.

Never needed this but then again I always use Quantums.
But I'd like to speak to the nitwit who told you that line 40 of the SCSI-
cable is a "power good" signal. It isn't ! It is the *RESET* line.
If it helps in your case, very good. But let's just call things what they are.

Yes, works fine. Only probs to watch out for are the SCSI termination which
should be set on the last (physical) drive in the chain.

Hi Dr Simon,

> Incidentally I use the Epson Stylus COlor on my Atari TT, imagecopy
> produces far better output than the windows drivers on a pc!

Hah! Imagecopy rules! The newest v4 is truly fantastic!

> Also I've got the driver pack for Calamus SL, p.s. you don't need the
> latest version of calamus for 720dpi output, there are 2 versions of
> the job module available, depending on which version of calamus you
> use.

Right, but after asking Alastair Craig (JCA Europe) about this, I came to the conclusion that the easiest and best option for my customer (who had problems with 720dpi printouts from SL) would be to upgrade to the nov'94 release.

Alastair also mentioned the job module, but that seemed less practical/economical.

Hello,

I have a friend who has recently changed from an Atari Falcon to a PC. He wanted to use the same file he used on Data Manager Professional on his Falcon to MS Works on his PC but his PC is not playing!!! He did save the file in some kind of format on an IBM diskette and it is possible to see using MS Dos Editor, it is just that is is full of garbage, and is not recognised in any windows programmes. The files have DAT extensions and I would be really grateful if someone could give me some guidance as to what to do about this problem. It would be possible to send you the file if necessary but any form of instructon or help would be greatly appreciated via direct email to conibear@dircon.co.uk

Thankyou

> I got a Megafile-30 hard disk (and no atari computer), and I'm
> wondering if I can use the disk with some other system, e.g. some
> PC, or even my CP/M system (that needs a SASI disk).

Yes.. If you open it and removes the drive. You can use the drive with a standard RLL/MFM controller card to Pc.

> If I take the Megafile-30 apart, can I use the drive with a standard RLL
> disk controller on a PC?
>

Hehe.. I should have read the whole letter first ;)

Yes you can.

I always download all my atari files using Netscape, Gopher or Rapid filer on my PC at work. Just format 3.5" disks to 720K and save the files on them, ready to go in the atari! Or if you've a TT or falcon, you could use HD disks.

Simon

You don't need a ROM upgrade in order to use MagiC effectively - MagiC
replaces the *entire* BIOS, XBIOS, GEMDOS, VDI and AES.

The one downside to MagiC is that it will use up some RAM (don't know
how much, but probably less than MTOS does). which the ROM upgrade
obviously won't. But you can get around this by blowing MagiC onto
EPROMs using a free utility (MAGXROM IIRC)

You don't say what sort of adapter but, to be safe, get a drive which can
have parity disabled by jumper.

If you have as STF the drive performance is not so important so save money
by going for SCSI-1 rather than SCSI-2 (technically both will be OK but the
higher SCSI-2 spec. will be wasted on a 8Mhz m/c).

Why not look for a second-hand drive? It CAN be a bit risky but you can get
good deals from people who are upgrading.

Did he save it as an ASCII file? It seems that Data Manager uses a
different form or character to delimit one field from another, so
the DAT files are not compatible with "standard" data bases. Most
bases can, however accept an ASCII file as a data fill.

I suggest you take a look at literature about PMMU programming. OUTSIDE does not have to interfere with TOS memory management. Everything OUTSIDE does is made using the PMMU so there is no need for changing the TOS memory allocation calls. Virtual memory is totally transparent for applications not using the PMMU. Your applications won't even be able to tell that a virtual memory manager is active. Even TOS isn't aware of virtual memory.

Another source, for the faint of heart, is Wizztronics. They sell
a product called the Dorsal Adapter Board. No soldering to the PAL's.
Just remove them, insert the Dorsal and reinsert the PAL's. Remove
R216 and R221 and just two leads to solder. Much nicer looking than
what Atari has recommended we do. (Uses 74F08, R216 and R221 jumped
second lead to R217.) I don't use Cubase, but have noticed no problems
on my machine. $35.00 U.S. (Kinda steap, but whats you M/B worth?)

3689. TOS Error #35

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-12 00:00:00 UTC
From: Trevor@fawley.demon.co.uk
Message-ID: <810892074.19066@fawley.demon.co.uk>
Source record: 24508

Hi

I am posting this message on behalf of a friend who is having problems with an Atari 1040ST ----

My origional copy of 1st Word Plus is damaged and I am trying to use a backup copy (3.5" disk). I keep getting the following message..

TOS Error #35

Data on the dosk in drive A may be damaged. You must use the right kind of floppy disk; You must connect you hard disk poperly.

Other disks seem to work OK in this drive.

Any ideas?

If its the disk thats faulty, does anyone know of a supplier of 1st Word Plus in the UK?

TIA

Trevor Smith

3690. 48mhz Falcon DSP?

Newsgroup: comp.sys.atari.st.tech

I downloaded a German.txt file by Mitja Rateiczak detailing modifications to bring the Falcon DSP to 48mhz. X-lator helped me follow the document somewhat, but I would like to hear from someone that has done the mod and could detail it in English. Anyone?

His E-Mail is mitja_rateiczak@bm.maus.de

3691. SLM804 Laser and Macintosh IIvx??????

Newsgroup: comp.sys.atari.st.tech
Date: 1995-09-12 00:00:00 UTC
From: jerbil@Gramercy.ios.com
Message-ID: <jerbil-1209950930530001@ppp-33.ts-2.nyc.idt.net>
Source record: 24510

Does anyone know if the Atari SLM804 Laser printer can be connected to a Macintosh IIvx?? If so, how is it done and what extras arec needed and is it worth it after all??

Thanks,

Jeff B

Does anybody know how to program Microdeal's Video Master on an STE?
I want to digitize frames, and store as either single pictures or as
animation sequences.
Preferably in GFAbasic or assembler.

Actually, it was an Atari engineer at Atari Benelux...

>If it helps in your case, very good. But let's just call things what they are.

Ok... do you by chance have full pinouts for the SCSI? I'd be very interested
in having it for my collection of hardware documentation. ;^)

Which apparently does not run Cubase....
I hope there's an easy way to boot without it.

Paul van Niekerk (niekerk@prl.philips.nl) wrote:
: I got a Megafile-30 hard disk (and no atari computer), and I'm
: wondering if I can use the disk with some other system, e.g. some
: PC, or even my CP/M system (that needs a SASI disk).

The politially correct solution is to get yourself an Atari computer,
of course 8-)

: Questions:
: What is the DMA-bus that connects the disk to the computer?
: What protocol runs on this bus?

The DMA bus is also called ACSI (Atari Computer Systems Interface). It's
a stripped-down version of SCSI. The restrictions are:

- No arbitration phase
- No disconnect
- Class 0 commands only (well, at least without a special hack)
- No parity
- Speed lower than 2 MB/s (due to limitations of the DMA chip in
the Atari)
- And others I've forgotten 8-)

: If I take the Megafile-30 apart, can I use the drive with a standard RLL
: disk controller on a PC?

Yes. Inside the Megafile 30, you find the following:

- An ACSI-to-SCSI hostadaptor
- A SCSI-to-ST506 controller (Adaptec 4070)
- A 30 MB RLL drive with an ST506/412 bus

Unfortunately, the hostadaptor and the controller are on the same board,
and it's probably tricky to use the board as a SCSI controller only.

> C302434-001/A
> MM9291-N1

The 1772 FDD controller has the atari part number C026028-002
in the STE manual (located at U301)

> The board itself is marked:
>
> CA401177

The Mother board should have the atari part Number C300779-001
for the STE.

> The board was bought as an upgrade to an STFM which required
>expensive repairs due to abuse from it's previous owner.

SO you probably have a STFM mother board!

> 2 questions. a: Can anyone provide any info/ID for the C302434 chip?
>and b: Will this chip make it any easier to change the disk drive to
>High Density or will it drive me nuts just planning the job?
>
You can just replace the old floppy drive with a new HD floppy
but you can only use it as a 720K drive. An upgrade is availiable
from the usual suppliers (System Solutions or COMPO) to use the
HD drive in the HD mode.

> I have heard previously of an 'Ajax' chip which I believe was used as
>the controller in the Mega STe, but surely not in the plain vanilla
>520?

This ususally requires the Ajax chip as the clock frequency is increased
to 16MHZ from 8MHz for the HD controller and the 1772 may not be able to
handle this frequency.

> That's 3 questions, any answers get my tha

your welcome
